

LA7567GM

TV and VCR VIF/SIF IF Signal-Processing Circuit with NTSC SPLIT Support

Overview

The LA7567GM is an NTSC SPLIT support VIF/SIF IF IC that adopts a semi-adjustment-free system. The VIF block adopts a technique that makes AFT adjustment unnecessary by adjusting the VCO, thus simplifying the adjustment steps in the manufacturing process. PLL detection is adopted in the FM detector. A 5-V power-supply voltage is used to match that used in most multimedia systems. In addition, this IC also includes a buzz canceller to suppress Nyquist buzz and provide high audio quality.

Functions

[VIF]

- VIF amplifier • PLL detector • BNC • RF AGC
- EQ amplifier • AFT • IF AGC • Buzz canceller

[First SIF]

- First SIF • First SIF detector • AGC

[SIF]

- Multi-format SIF converter • Limiter amplifier • PLL FM detector

Features

- Both AFT and SIF inductors built in, thus making adjustment of external inductance unnecessary.
- Built-in buzz canceller for excellent audio performance.
- $V_{CC} = 5\text{ V}$, low power dissipation (250 mW)

Package Dimensions

unit: mm

3112A-MFP24S

Specifications

Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{CC\text{ max}}$		6	V
Circuit voltage	V13, V17		V_{CC}	V
Circuit current	I6		-3	mA
	I10		-10	mA
	I24		-2	mA
Allowable power dissipation	$P_{d\text{ max}}$	$T_A \leq 50^\circ\text{C}$, Independent IC *: Mounted on a printed circuit board	420	mW
			720	mW
Operating temperature	T_{opr}		-20 to +70	$^\circ\text{C}$
Storage temperature	T_{stg}		-55 to +150	$^\circ\text{C}$

Note: When mounted on a $65 \times 72 \times 1.6\text{ mm}$ paper/phenolic resin printed circuit board.

■ Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.

■ SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

Sample Application Circuit

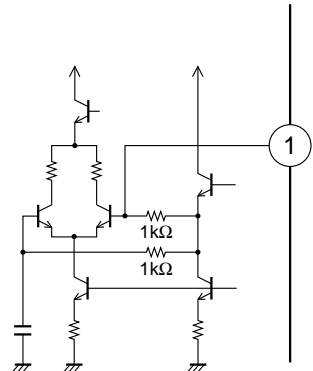

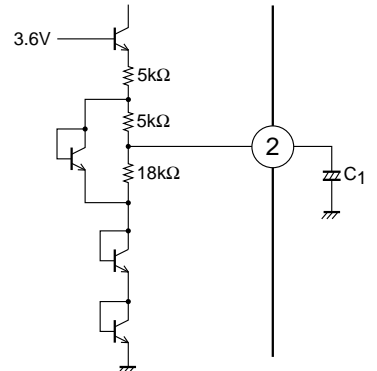

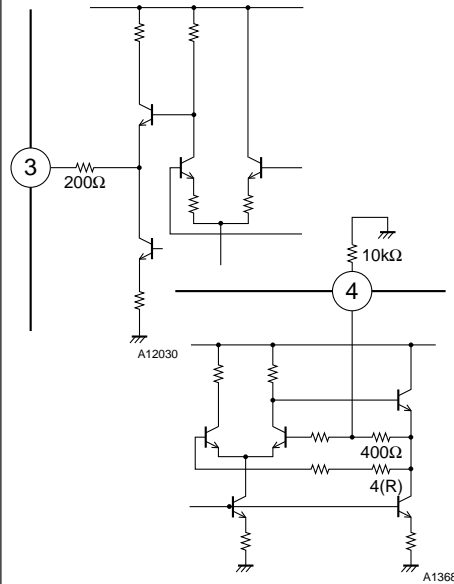

When the SIF, first SIF, AFT, and RF AGC circuits are not used:

- When the SIF circuit is not used:
Leave pins 1, 23, and 24 open.
Connect pin 2 to ground through a 2-k Ω resistor.
- When the first SIF circuit is not used:
Leave pins 3, 4, 15 and 22 open.
Connect pin 16 to ground.
- When the AFT circuit is not used:
Since there is no way to defeat the AFT circuit, connect a 100-k Ω resistor and a 0.01- μ F capacitor in parallel between pin 13 and ground.
- When the RF AGC circuit is not used:
Leave pins 14 and 21 open.
Insert a 0.01- μ F capacitor between pin 21 and ground for oscillation prevention.

Pin Descriptions

Pin No.	Pin	Description	Equivalent circuit
1	SIF INPUT	<ul style="list-style-type: none"> SIF input. The input impedance is about 1 kΩ. Since buzzing and buzz beating can occur if interference enters this input pin, care must be taken when design the pattern layout for this pin. Note that the video and chrominance signals are especially likely to interfere with the audio signal. Also, the VIF carrier signal can also cause interference. 	 <p>A13680</p>
2	FM power supply filter	<ul style="list-style-type: none"> FM detector bias line filter input. Used to improve the FM detector signal-to-noise ratio. C1 should be at least 0.47 μF, and 1 μF is recommended. If the FM detector is not used, connect pin 2 to ground through a 2-kΩ resistor. This stops the FM detector VCO. 	 <p>A13681</p>
3 4	SIF converter	<ul style="list-style-type: none"> Pin 3 is the SIF converter output. The signal is passed through a 6-MHz bandpass filter and input to the SIF circuit. 	 <p>A12030 A13682</p>
5	V _{CC}	<ul style="list-style-type: none"> Use the shortest distance possible when decoupling V_{CC} and ground.

Pin No.	Pin	Description	Equivalent circuit
6 7 8	EQ amp	<ul style="list-style-type: none"> Equalizer circuit. This circuit is used to correct the video signal frequency characteristics. Pin 8 is the EQ amplifier input. This amplifier amplifies a 1.5-V p-p video signal to 2-V p-p. Notes on equalizer amplifier design The equalizer amplifier is designed as a voltage follower amplifier with a gain of about 0 dB. When used for frequency characteristics correction, a capacitor, inductor, and resistor must be connected in series between pin 7 and ground. Approach used in the equalizer amplifier If v_i is the input signal and v_o is the output signal, then: $\frac{R_1}{2} + 1 (v_i + v_{in}) = V_o \times G$ <p>Where G is the voltage-follower amplifier gain. Assume: v_{in}: Imaginary short G: About 0 dB $v_{in} \approx 0$. Then: $AV = \frac{v_o G}{v_i} = \frac{R_1}{Z} + 1$</p> R_1 is the IC internal resistance, and is 1 kΩ. In the application design, simply select Z to correspond to the desired characteristics. However, since the EQ amplifier gain will be maximum at the resonant point defined by Z, care is required to assure that distortion does not occur. 	 <p style="text-align: right;">A13683</p>  <p style="text-align: right;">A13684</p>
9	APC FILTER	<ul style="list-style-type: none"> PLL detector APC filter connection. The APC time constant is switched internally in the IC. When locked, the VCO is controlled by loop A and the loop gain is reduced. When unlocked and during weak field reception, the VCO is controlled by loop B and the loop gain is increased. <p>For this APC filter we recommend: $R = 150 \text{ to } 390 \text{ } \Omega$ $C = 0.47 \text{ } \mu\text{F}$</p>	 <p style="text-align: right;">A13685</p>

Pin No.	Pin	Description	Equivalent circuit
21	RF AGC VR	<ul style="list-style-type: none"> RF AGC VR connection. <p>This pin sets the tuner RF AGC operating point. Also, the FM output and the video output can both be muted at the same time by connecting this pin to ground.</p>	<p>A13694</p>
22	NICAM output	<ul style="list-style-type: none"> First SIF output. <p>Internally, this is an emitter-follower output with a 600-Ω resistor attached. When used in an intercarrier system, the buzz characteristics can be improved by forming a chrominance carrier trap with this pin.</p>	<p>A13695</p>
23	FM filter	<ul style="list-style-type: none"> Connection for a filter used to hold the FM detector output DC voltage fixed. Normally, a 1-μF electrolytic capacitor should be used. The capacitance should be increased if the low band (around 50 Hz) frequency characteristics need to be improved. The FM detector output level can be reduced and the FM dynamic range can be increased by inserting a resistor and a capacitor in series between pin 23 and ground. 	<p>A13696</p>
24	FM Detector output	<ul style="list-style-type: none"> Audio FM detector output. A 300-Ω resistor is inserted in series with an emitter-follower output. For applications that support stereo: Applications that input this signal to a stereo decoder may find that the input impedance is reduced, the left and right signals are distorted, and that the stereo characteristics are degraded. If this problem occurs, add a resistor between pin 24 and ground. $R1 \geq 5.1 \text{ k}\Omega$ For applications that support mono: Create an external deemphasis circuit. $t = C \times R2$ 	<p>A13697</p>

Notes on Sanyo SAW Filters

There are two types of SAW filters, which differ in the piezoelectric substrate material, as follows:

- Lithium tantalate (LiTaO₃) SAW filter

TSF11□□ ... Japan

TSF12□□ ... US

Although lithium tantalate SAW filters have the low temperature coefficient of $-18 \text{ ppm}/^{\circ}\text{C}$, they suffer from a large insertion loss. However, it is possible, at the cost of increasing the number of external components required, to minimize this insertion loss by using a matching circuit consisting of coils and other components at the SAW filter output. At the same time as minimizing insertion loss, this technique also allows the frequency characteristics, level, and other aspects to be varied, and thus provides increased circuit design flexibility. Also, since the SAW filter reflected wave level is minimal, the circuit can be designed with a small in-band ripple level.

- Lithium niobate (LiNbO₃) SAW filter

TSF52□□ ... US

TSF53□□ ... PAL

Although lithium niobate SAW filters have the high temperature coefficient of $-72 \text{ ppm}/^{\circ}\text{C}$, they feature an insertion loss about 10 dB lower than that of lithium tantalate SAW filters. Accordingly, there is no need for a matching circuit at the SAW filter output. Although the in-band ripple is somewhat larger than with lithium tantalate SAW filters, since they have a low impedance and a small field slew, they are relatively immune to influences from peripheral circuit components and the geometry of the printed circuit board pattern. This allows stable out-of-band trap characteristics to be acquired. Due to the above considerations, lithium tantalate SAW filters are used in applications for the US and Japan that have a high IF frequency, and lithium niobate SAW filters are used in PAL and US applications that have a low IF frequency.

Notes on SAW Filter Matching

In SAW filter input circuit matching, rather than matching the IF frequency, flatter video band characteristics can be acquired by designing the tuning point to be in the vicinity of the audio carrier rather than near the chrominance carrier. The situation shown in figure on the right makes it easier to acquire flat band characteristics than that in figure on the left.

Notes on VCO Tank Circuits

- Built-in capacitor VCO tank circuits

When the power is turned on, the heat generated by the IC is transmitted through the printed circuit board to the VCO tank circuit. At this point, the VCO coil frame functions as a heat sink and the IC heat is dissipated. As a result, it becomes more difficult to transmit heat to the VCO tank circuit's built-in capacitor, and the influence of drift at power on is reduced. Therefore, it suffices to design the circuit so that the coil and capacitor thermal characteristics cancel. Ideally, it is better to use a coil with a core material that has low temperature coefficient characteristics.

- External capacitor VCO tank circuits

When an external capacitor is used, heat generated by the IC is transmitted through the printed circuit board directly to the VCO tank circuit external capacitor. While this capacitor is heated relatively early after the power is turned on, the coil is not so influenced as much by this heat, and as a result the power-on drift is increased. Accordingly, a coil whose core material has low temperature coefficient characteristics must be used. It is also desirable to use a capacitor with similarly low temperature coefficient characteristics.

Note: Applications that use an external capacitor here must use a chip capacitor. If an ordinary capacitor is used, problems such as the oscillator frequency changing with the capacitor orientation may occur.
