

**LB1847****PWM Current Control Type Stepping Motor Driver****Overview**

The LB1847 is a driver IC for stepping motors with PWM current control bipolar drive (fixed OFF time). A special feature of this IC is that V_{REF} voltage is constant while the current can be set in 15 steps, allowing drive of motors ranging from 1-2 phase exciter types to 4W 1-2 phase exciter types. The current decay pattern can also be selected (SLOW DECAY, FAST DECAY, MIX DECAY) to increase the decay of regenerative current at chopping OFF, thereby improving response characteristics. This is especially useful for carriage and paper feed stepping motors in printers and similar applications where high-precision control and low vibrations are required.

Package Dimensions

unit: mm

3147B-DIP28H**Features**

- PWM current control (fixed OFF time)
- Load current digital selector (1-2, W1-2, 2W1-2, 4W1-2 phase exciter drive possible)
- Selectable current decay pattern (SLOW DECAY, FAST DECAY, MIX DECAY)
- Simultaneous ON prevention function (feedthrough current prevention)
- Noise canceler
- Built-in thermal shutdown circuit
- Built-in logic low-voltage OFF circuit

■ Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.

■ SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

Specifications

Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Motor supply voltage	V_{BB}		50	V
Output peak current	I_{OPEAK}	$t_W \leq 20 \mu\text{s}$	1.75	A
Output continuous current	$I_O \text{ max}$		1.5	A

Notes on Usage

1. External diodes

Because this IC uses top-side transistor switching in SLOW DECAY mode and dual-side transistor switching in FAST DECAY mode, it requires external diodes between the OUT pins and ground, for the regenerative current during switching OFF. Use Schottky barrier diodes with low VF.

2. VREF pin

Because the VREF pin serves for input of the set current reference voltage, precautions against noise must be taken. The input voltage range is 0 to 3.0V.

3. GND pin

The ground circuit for this IC must be designed so as to allow for high-current switching. Blocks where high current flows must use low-impedance patterns and must be removed from small-signal lines. Especially the ground connection for the sensing resistor RE at pin E, and the ground connection for the Schottky barrier diodes should be in close proximity to the IC ground.

The capacitors between VCC and ground, and VBB and ground should be placed close to the VCC and VBB pins, respectively.

4. Simultaneous ON prevention function

This IC incorporates a circuit to prevent feedthrough current when phase switching. For reference, the output ON and OFF delay times at PHASE and ENABLE switching are given below.

Reference data * typical value

		Sink side	Source side
PHASE switching (Low -> Hi)	ON delay time	1.9 μ s	2.2 μ s
	OFF delay time	0.8 μ s	1.8 μ s
PHASE switching (Hi -> Low)	ON delay time	1.4 μ s	1.7 μ s
	OFF delay time	0.9 μ s	1.35 μ s
ENABLE switching	ON delay time	2.15 μ s	2.75 μ s
	OFF delay time	1.2 μ s	5.8 μ s

5. Noise canceler

This IC has a noise canceling function to prevent malfunction due to noise spikes generated when switching ON. The noise cancel time t_n is determined by internal resistance of the CR pin and the constant of the externally connected CR components. The constant also determines the switching OFF time.

Figure 1 shows the internal configuration at the CR pin, and Figure 2 the CR pin constant setting range.

Equation when logic voltage $V_{CC} = 5\text{ V}$

CR pin voltage $E1 = V_{CC} \cdot R / (R1 + R2 + R)$ [V]

Noise cancel time $t_n \approx (R1 + R2) \cdot C \cdot \ln \{(E1 - 1.5) / (E1 - 4.0)\}$ [s]

Switching OFF time $t_{off} \approx -R \cdot C \cdot \ln (1.5 / E1)$ [s]

Internal resistance at CR pin : $R1 = 1\text{ k}\Omega$, $R2 = 300\Omega$ (typ.)

*The CR constant setting range in Figure 2 on page 15 is given for reference. It applies to a switching OFF time in the range from 8 to 100 μ s. The switching time can also be made higher than 100 μ s. However, a capacitor value of more than several thousand pF will result in longer noise canceling time, which can cause the output current to become higher than the set current. The longer switching OFF time results in higher output current ripple, causing a drop in average current and rotation efficiency. When keeping the switching OFF time within 100 μ s, it is recommended to stay within the CR constant range shown in Figure 2.

Internal configuration at CR pin
