

Four-Bit Single-Chip Microcontrollers with 4, 6, 8, 12, and 16 KB of On-Chip ROM

Preliminary

Overview

The LC665304A, LC665306A, LC665308A, LC665312A, and LC665316A are 4-bit CMOS microcontrollers that integrate on a single chip all the functions required in a system controller, including ROM, RAM, I/O ports, a serial interface, 16-value comparator inputs, timers, interrupt functions, and an optional sub-oscillator circuit. These microcontrollers are available in a 48-pin package.

Features and Functions

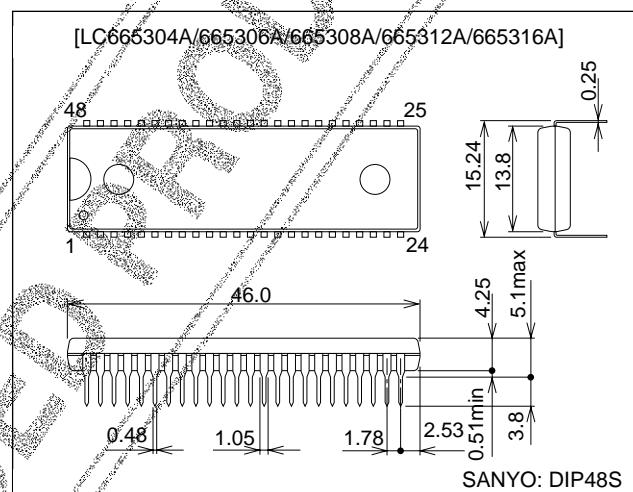

- On-chip ROM capacity of 4, 6, 8, 12, and 16 kilobytes, and an on-chip RAM capacity of 512×4 bits.
- Fully supports the LC66000 Series common instruction set (128 instructions).
- I/O ports: 42 pins
- A sub-oscillator circuit can be used (option)
This circuit allows power dissipation to be reduced by operating at lower speeds.
- 8-bit serial interface: two circuits (can be connected in cascade to form a 16-bit interface)
- Instruction cycle time: 0.95 to 10 μ s (at 3 to 5.5 V)
- Powerful timer functions and prescalers
 - Time limit timer, event counter, pulse width measurement, and square wave output using a 12-bit timer.
 - Time limit timer, event counter, PWM output, and square wave output using an 8-bit timer.
 - Time base function using a 12-bit prescaler.
- Powerful interrupt system with 8 interrupt factors and 8 interrupt vector locations.
 - External interrupts: 3 factors/3 vector locations
 - Internal interrupts: 5 factors/5 vector locations
- Flexible I/O functions
 - 16-value comparator inputs, 20-mA drive outputs, inverter circuits, pull-up and open-drain circuits selectable as options
- Optional runaway detection function (watchdog timer)
- 8-bit I/O functions
- Power saving functions using halt and hold modes.
- Packages: DIP48S, QIP48E (QFP48E)

- Evaluation LSIs: LC66599 (evaluation chip) + EVA800/850-TB662YXX2
- LC66E5316(on-chip EPROM microcontroller)

Pin Assignments

We recommend the use of reflow soldering techniques to solder-mount QFP packages.

Please consult with your Sanyo representative for details on process conditions if the package itself is to be directly immersed in a dip-soldering bath (dip-soldering techniques).

Pin Function Overview

Pin	I/O	Overview	Output driver type	Options	State after a reset	Standby mode operation
P00 P01 P02 P03	I/O	I/O ports P00 to P03 • Input or output in 4-bit or 1-bit units • P00 to P03 support the halt mode control function (This function can be specified in bit units.)	• Pch: Pull-up MOS type • Nch: Intermediate sink current type	• Pull-up MOS or Nch OD output • Output level on reset	High or low (option)	Hold mode: Output off Halt mode: Output retained
P10 P11 P12 P13	I/O	I/O ports P10 to P13 Input or output in 4-bit or 1-bit units	• Pch: Pull-up MOS type • Nch: Intermediate sink current type	• Pull-up MOS or Nch OD output • Output level on reset	High or low (option)	Hold mode: Output off Halt mode: Output retained
P20/SI0 P21/SO0 P22/SCK0 P23/INT0	I/O	I/O ports P20 to P23 • Input or output in 4-bit or 1-bit units • P20 is also used as the serial input SI0 pin. • P21 is also used as the serial output SO0 pin. • P22 is also used as the serial clock SCK0 pin. • P23 is also used as the INT0 interrupt request pin, and also as the timer 0 event counting and pulse width measurement input.	• Pch: CMOS type • Nch: Intermediate sink current type • Nch: +7-V handling when OD option selected	CMOS or Nch OD output	H	Hold mode: Output off Halt mode: Output retained
P30/INT1 P31/POUT0 P32/POUT1	I/O	I/O ports P30 to P32 • Input or output in 3-bit or 1-bit units • P30 is also used as the INT1 interrupt request. • P31 is also used for the square wave output from timer 0. • P32 is also used for the square wave and PWM output from timer 1. • P31 and P32 also support 3-state outputs.	• Pch: CMOS type • Nch: Intermediate sink current type • Nch: +7-V handling when OD option selected	CMOS or Nch OD output	H	Hold mode: Output off Halt mode: Output retained
P33/HOLD	I	Hold mode control input • Hold mode is set up by the HOLD instruction when HOLD is low. • In hold mode, the CPU is restarted by setting HOLD to the high level. • This pin can be used as input port P33 along with P30 to P32. • When the P33/HOLD pin is at the low level, the CPU will not be reset by a low level on the RES pin. Therefore applications must not set P33/HOLD low when power is first applied.				
P40/INV0I P41/INV0O P42/INV1I P43/INV1O	I/O	I/O ports P40 to P43 • Input or output in 4-bit or 1-bit units • Input or output in 8-bit units when used in conjunction with P50 to P53. • Can be used for output of 8-bit ROM data when used in conjunction with P50 to P53. • Dedicated inverter circuit (option)	• Pch: Pull-up MOS type • CMOS type when the inverter circuit option is selected • Nch: Intermediate sink current type	• Pull-up MOS or Nch OD output • Output level on reset • Inverter circuit	High or low or inverter I/O (option)	Hold mode: Port output off, inverter output off Halt mode: Port output retained, inverter output continues

Note: Pull-up MOS type: The output circuit includes a MOS transistor that pulls the pin up to V_{DD}.

CMOS output: Complementary output.

OD output: Open-drain output.

User Options

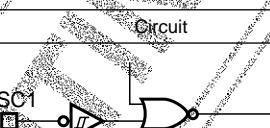

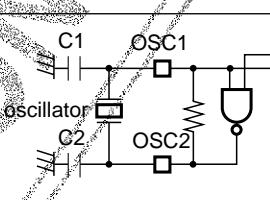

1. Port 0, 1, 4, 5, and 8 output level at reset option

The output levels at reset for I/O ports 0, 1, 4, 5, and 8, in independent 4-bit groups, can be selected from the following two options.

Option	Conditions and notes
1. Output high at reset	The four bits of ports 0, 1, 4, 5, or 8 are set in a group
2. Output low at reset	The four bits of ports 0, 1, 4, 5, or 8 are set in a group

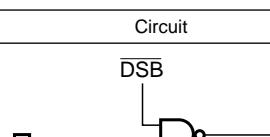

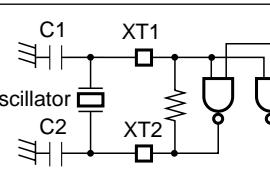

2. Oscillator circuit options

- Main clock

Option	Circuit	Conditions and notes
1. External clock		The input has Schmitt characteristics
2. Ceramic oscillator		

Note: There is no RC oscillator option.

- Sub-clock

Option	Circuit	Conditions and notes
1. Ports PE0 and PE1		
2 Sub-oscillator (crystal oscillator)		

3. Watchdog timer option

A runaway detection function (watchdog timer) can be selected as an option.

4. Port output type options

- The output type of each bit (pin) in ports P0, P1, P2, P3 (except for the P33/HOLD pin), P4, P5, P6, and PC can be selected individually from the following two options.

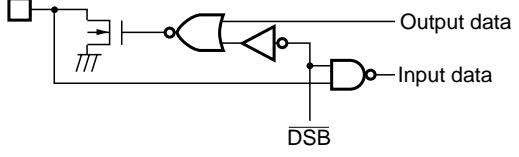

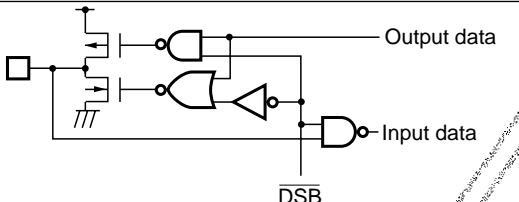

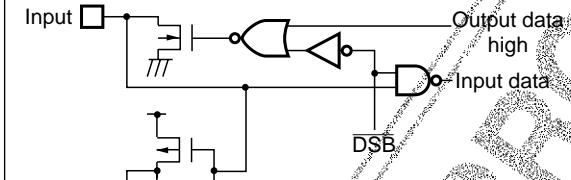

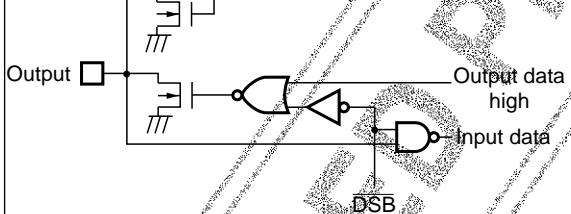

Option	Circuit	Conditions and notes
1. Open-drain output		The port P2, P3, P5, and P6 inputs have Schmitt characteristics.
2. Output with built-in pull-up resistor		The port P2, P3, P5, and P6 inputs have Schmitt characteristics. The CMOS outputs (ports P2, P3, P6, and PC) and the pull-up MOS outputs (P0, P1, P4, and P5) are distinguished by the drive capacity of the p-channel transistor.

- One of the following two options can be selected for P8, in bit units

Option	Circuit	Conditions and notes
1. Open-drain output		
2. Output with built-in pull-down resistor (CMOS output)		

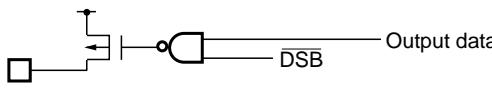

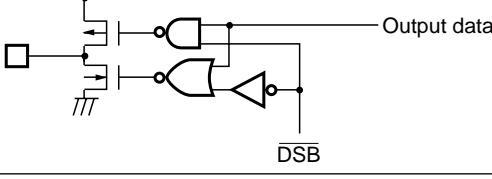

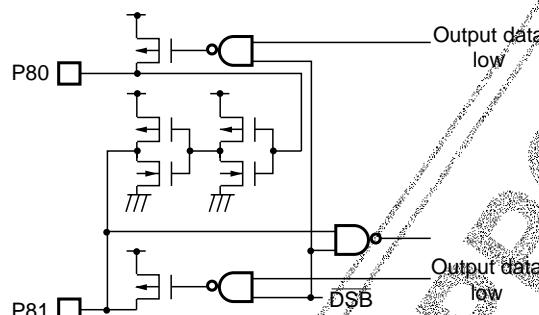

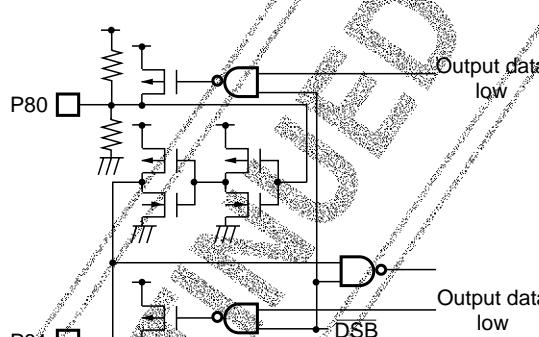

5. Inverter array circuit option

One of the following options can be selected for each of the following port sets: P40/P41, P42/P43, PC2/PC3, PD0/PD1, and PD2/PD3. (PDs do not use option 1 because they are dedicated to inputs)

Option	Circuit	Conditions and notes
1. Normal port I/O circuit	 	When the open-drain output type is selected When the built-in pull-up resistor output type is selected The CMOS outputs (PC) and the pull-up MOS outputs (P4) are distinguished by the drive capacity of the p-channel transistor.
2. Inverter I/O circuit	 	If this option is selected, The I/O circuit is disabled by the DSB signal. Also note that the open-drain port output type option and the high level at reset option must be selected.

6. Buffer array circuit option

In addition to normal port output, one of the following two options may also be selected for P80 and P81.

Option	Circuit	Conditions and notes
1. Normal port output	 	When the open-drain output type is selected
2. Buffer input (P80) and buffer output (P81) circuits		If this option is selected, the I/O circuit is disabled by the \overline{DSB} signal. Also note that the open-drain port output type option and the high level at reset option must be selected.
3. Buffer input (P80) and buffer output (P81) circuits with built-in zero-cross detection circuits		If this option is selected, the I/O circuit is disabled by the \overline{DSB} signal. Also note that the open-drain port output type option and the high level at reset option must be selected.

Note: 1. Applies to pins with open-drain output specifications. For pins with other than open-drain output specifications, the ratings in the pin column for that pin apply.

2. For the oscillator input and output pins, levels up to the free-running oscillation level are allowed.
3. Sink current (Applies to P8 and PD when either the CMOS output specifications or the inverter array specifications have been selected.)
4. Source current (Applies to all pins except P8 and PD for which the pull-up output specifications, the CMOS output specifications, or the inverter array specifications have been selected. Applies to PD pins for which the inverter array specifications have been selected.) Contact your Sanyo representative for the electrical characteristics when the inverter array or buffer array options are specified.
5. We recommend the use of reflow-soldering techniques to solder-mount QFP packages.

Please consult with your Sanyo representative for details on process conditions if the package itself is to be directly immersed in a dip-soldering bath (dip-soldering spray techniques).

Allowable Operating Ranges at $T_a = -30$ to $+70^\circ\text{C}$, $V_{SS} = 0 \text{ V}$, $V_{DD} = 3.0$ to 5.5 V , unless otherwise specified.
