LC66E308

4-Bit Single Chip Microcomputer with EPROM

Overview

The LC66E308 is a 4-bit single chip microcomputer with an EPROM on-chip, and can be used for developing and evaluating application programs for the LC6630X series 4-bit single chip microcomputers.

The LC66E308 microcomputer is a 4-bit single chip LSI with an EPROM on-chip and brought to you in ceramic 42-pin dual-in-line package (DIP) form with a window. This window permits the user to erase EPROM program data as many times as he or she wants. Then, it could be said that this single chip LSI is best suited for developing application programs.

The LC66E308 microcomputer has the same function and the pin assignment as those of the 4-bit single chip mask programmed ROM-version LC66308A microcomputer. The on-chip EPROM is 8K bytes in size.

Features

(1) Option functions user-selectable by specifying EPROM option data

The 33 optional functions on the LC6630X series single chip microcomputers can be selected by writing appropriate data to the on-chip EPROM. This function specification by the user allows application system to be developed and tested under the same working environment as that of production chip. In other words, the same interface circuit functions as those of production chips can be built up by the user.

Please note that the above-mentioned optional functions include port output type (open drain or pull-up), output pin logic level at reset, watchdog timer selection and the like.

(2) On-chip 8KB EPROM

The on-chip EPROM enables the user to develop and evaluate application programs which can be run on every LC6630X series microcomputer. Please note that the LC6630X series microcomputers are LC66304A, LC66306A, LC66308A and that they are listed in the table below with a few pieces of information.

(3) Write/Read operation with an EPROM writer

Used with the dedicated writer board (42 pins into 28 pins: W66EP308D), an EPROM writer available on your local market permits the user to write or read data to or from the 8KB on-chip EPROM. Please note that the EPROM writer should be an ADVANTEST product or the EVA850/800 accessory writer used for the 27128 type EPROM. The addresses should be set to 0000H to 2007H.

(4) Pin compatible with a mask programmed ROM-version single chip microcomputer (LC66308A, for example)

(5) Instruction cycle time: 0.92μs to 10μs

(6) Single +5V power supply (Ta = -10 °C to 40 °C)

Configurations

Type Number	Pins	ROM size	RAM size	Package	Remark
LC66304A/306A/308A	42	4K/6K/8KB	512W	DIP42S	under development
LC66E308	42	EPROM8KB	512W	DIC42S with window	under development
LC66P308	42	OTPROM8KB	512W	DIP42S	under development
LC66506B/508B/512B/516B	64	6K/8K/12K/16KB	512W	DIP64S, QIP64	Available
LC66E516	64	EPROM16KB	512W	DIC64S with window	Available
LC66P516	64	OTPROM16KB	512W	DIP64S	under development

The LC66599 (evaluation chip), being an LSI intended for evaluation, should be used with application development tool EVA850/800-TB6630X.

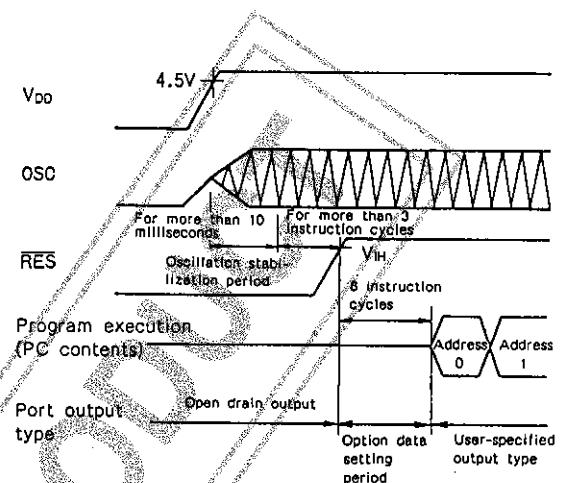

SANYO Electric Co., Ltd. Semiconductor Business Headquarters

Notes on use

The LC66E308 single chip LSI is intended for use by those who are in charge of the development and evaluation of application programs for the LC6630X series 4-bit single chip microcomputers. Please keep in mind the following items when the user application developers are to work with this single chip microcomputer.

(1) Notes on LC66E308 internal operations after reset

As the figure shows, the LC66E308 microcomputer starts normal program execution at least 3 instruction cycles later after the oscillation by the OSC function block becomes stable. In other words, the RES pin level(active low) must be active for at least 3 instruction cycles after the oscillation becomes stabilized. As the figure also shows, the oscillation stabilization requires more than 10 milliseconds. It is also shown that option data setting requires 8 instruction cycles after the RES pin level changes to the inactive level (or to V_H voltage level). After all those operations are carried out, the LC66E308 microcomputer starts program execution normally from address 0 in the EPROM (that is, the content at address 0 is automatically set in the program counter (PC)). At this point, please note that port output type will be open drain, not pull-up output type, as long as the RES pin stays active. It should be noted that P0, P1 are provided with pull-up resistor.)

**(2) Notes on evaluation of user application programs for the LC66304A, LC66306A microcomputers**

The above two mask programmed ROM-version microcomputers are equipped with different ROMs in size from that of the LC66E308 microcomputer. Therefore, the following things should be taken into consideration when you are to make an access to the ROM on the LC66E308 microcomputer.

First, it should be kept in mind that the 8 addresses between 2000H and 2007H are used by the user in order to specify functional option data. This 8-byte area is called option specification area. This option specification area must be exclusively used for storing function option data. The option specification will be discussed in detail later in this catalog.

As far as the cross assembler to be employed is concerned, the user should use "LC663S.EXE".

In addition, when you write your user application program, you cannot make any access to addresses beyond the area of a mask programmed ROM. Such addresses cannot exist anywhere on mask programmed ROM-version microcomputers. To avoid such an illegal access to those nonexistent area, it is recommended that jump (or branch) operations with a JMP instruction and so on be used in your user application program. Furthermore, please write "0" to the area beyond that of a mask programmed ROM. In this case, needless to say, the 8 addresses of the EPROM should be excluded from the "0" padding.

(3) Program protection from exposure to light

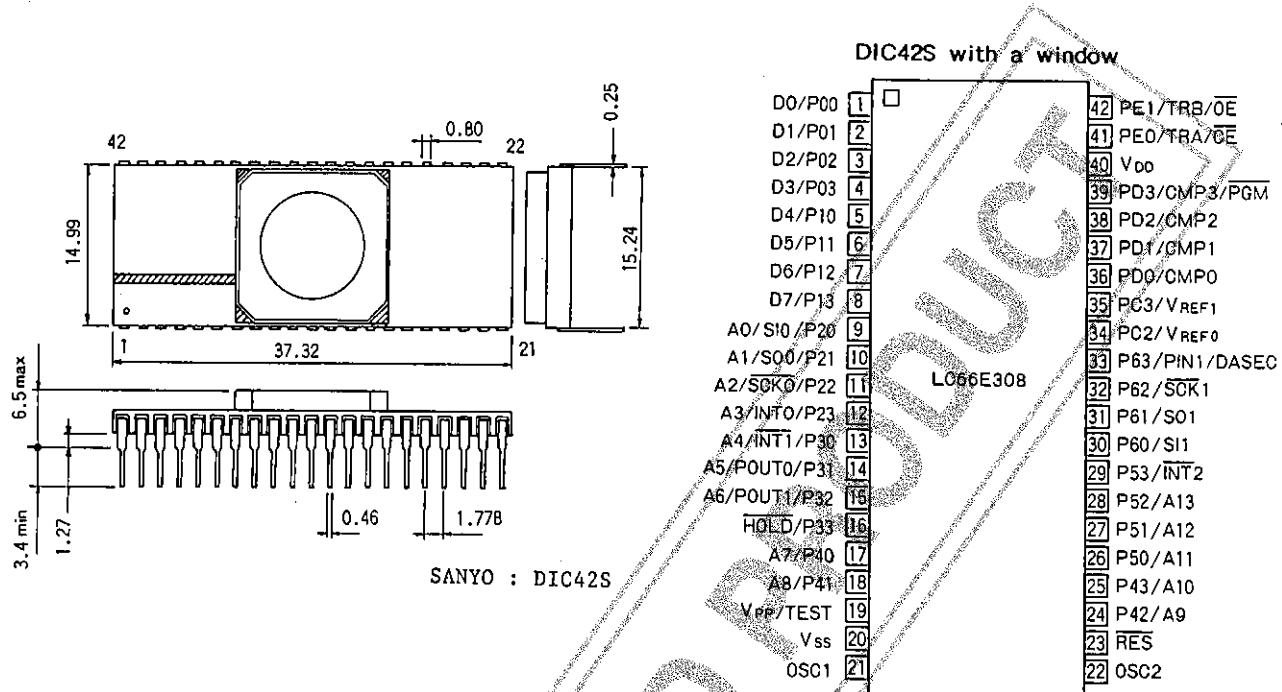

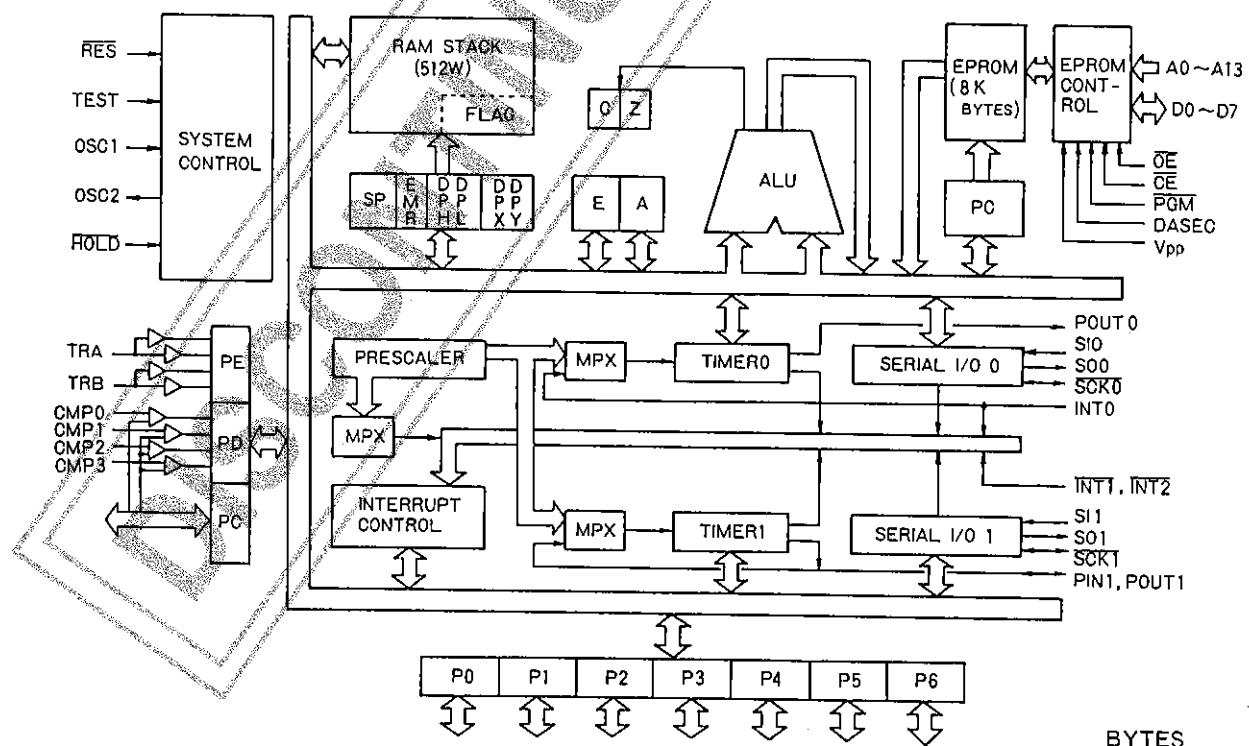

Exposure to light will destroy the precious EPROM data that you have entered with much labor. In order to protect them, it should be strongly recommended that the EPROM window should be covered with an opaque label while you are at work with the EPROM.

Comparison of LC66E308 and masked ROM version (LC6630X)

Item	LC66E308	Masked ROM version (LC6630X)
Operating supply voltage range (V _{DD})	4.5 to 5.5V	4.0 to 6.0V
Operating free-air temperature (T _{opg})	+10 to +40 °C	-30 to +70 °C
Current dissipation during HALT mode ON (I _{D(HALT)})	max. 5mA(4MHz ceramic resonator oscillation) max. 6mA(4MHz external clock source) max. 5mA(RC oscillation)	max. 2.5mA(4MHz ceramic resonator oscillation) max. 3.5mA(4MHz external clock source) max. 2.5mA(RC oscillation)
External RC oscillation time constant C _{ext} R _{ext}	typ 100pF T.B.D	typ 100pF typ 2.7kohm
Port output type at reset	Open drain output type (P0,P1:With pull-up resistor)	User specified output type (selected according to user option data)

- (4) For the LC66E308/P308, if the RES is set to "L" level during the HOLD mode (HOLD=L), be sure to change the HOLD level from "L" to "H" and then change the RES level from "L" to "H" when releasing the HOLD mode.

Pin assignment

External dimensions**System block diagram**

Pin description

Pin name	Input/ output	Functional description	Output driver circuit output type	Option	During EPROM mode operation
P00/D0 P01/D1 P02/D2 P03/D3	I/O	Input/output port pins P00 to P03 - Used for input/output operation in 4-bit units or bit units. - Used for controlling HALT mode operation.	- Pch: Pull-up (Pu) MOS type - Nch: Medium sink current output type	- Pull-up (Pu) MOS output type or Nch open drain (OD) output type - Output pin level at reset	Data input/ output pins (D0 to D3)
P10/D4 P11/D5 P12/D6 P13/D7	I/O	Input/output port pins P10 to P13 - Used for input/output operation in 4-bit units or bit units.	- Pch: Pull-up (Pu) MOS type - Nch: Medium sink current output type	- PU MOS output type or Nch OD output type - Output pin level at reset	Data input/output pins (D4 to D7)
P20/SI0/A0 P21/SO0/A1 P22/SCK0/A2 P23/INT0/A3	I/O	Input/output port pins P20 to P23 - Used for input/output operation in 4-bit units or bit units. - P20: Common with serial input SI0 - P21: Common with serial output SO0 - P22: Common with serial clock SCK0 - P23: Common with INT00 interrupt request input, timer 0-used event count input, pulse width measurement input	- Pch: CMOS type - Nch: Medium sink current output type - +15V withstand voltage at Nch open drain (OD) output	- CMOS output type or Nch OD output type	Address inputs (A0 to A3)
P30/INT1/A4 P31/POUT0 /A5 P32/POUT1 /A6	I/O	Input/output port pins P30 to P32 - Used for input/output operation in 3-bit units or bit units and for input operation in 4-bit units (together with the P33 pin) or bit units. - P30: Common with INT1 interrupt request input - P31: Common with burst pulse output from timer 0 - P32: Common with burst pulse output from timer 1 and PWM output	- Pch: CMOS type - Nch: Medium sink current output type - +15V withstand voltage for Nch OD output	- CMOS output type or Nch OD output type	Address input (A4 to A6)
P33/HOLD	I	HOLD mode control signal input - Used for activating HOLD operation mode with HOLD = L (active low) by using a HOLD instruction. - Used for restarting the CPU operation from the HOLD mode operation by changing the HOLD pin level from L to H. - Used as input port pin P33 to form a 4-bit input port with P30 to P32. The CPU blocks cannot be reset even if the RES (active low) pin level changes from H to L with the HOLD pin level = L. This means that you cannot write a user application program requiring the P33/HOLD pin to enter the L level state at the moment the system is powered on.			
P40/A7 P41/A8 P42/A9 P43/A10	I/O	Input/output port pins P40 to P43 - Used for input/output operation in 4-bit units or bit units. These four pins, combined with port pins P50 to P53, can be used for input/output operation in 8-bit units. - These four pins, together with port pins P50 to P53, can be used for 8-bit ROM data output.	- Pch: Pull-up (Pu) MOS type - Nch: Medium sink current output type - +15V withstand voltage for Nch OD output	- PU MOS output type or Nch OD output type	Address input (A7 to A10)
P50/A11 P51/A12 P52/A13 P53/INT2	I/O	Input/output port pins P50 to P53 - Used for input/output operation in 4-bit units or bit units. - These four pins, combined with port pins P40 to P43, can be used for input/output operation in 8-bit units. - These four pins, together with port pins P40 to P43, can be used for 8-bit ROM data output. - P53: Common with INT2 interrupt request	- Pch: Pull-up (Pu) MOS type - Nch: Medium sink current output type - +15V withstand voltage for Nch OD output	- PU MOS output type or Nch OD output type	Address input (A11 to A13)

Continued on next page.

Continued from previous page.

Pin name	Input/ output	Functional description	Output driver circuit output type	Option	During EPROM mode operation
P60/SI1 P61/SO1 P62/SCK1 P63/PIN1 /DASEC	I/O	Input/output port pins P60 to P63 - Used for input/output operation in 4-bit units or bit units. - P60: Common with serial input SI1 - P61: Common with serial output SO1 - P62: Common with serial clock SCKT - P63: Common with timer 1-used event count input	- Pch: CMOS type - Nch: Medium sink current output type +15V withstand voltage for Nch OD output	- CMOS output type or Nch OD output type	
PC2/VREF0 PC3/VREF1	I/O	Input/output port pins PC2 to PC3 - Used for input/output operation in 2-bit units or bit units. - PC2: Common with VREF0 comparator comparison voltage terminal - PC3: Common with VREF1 comparator comparison voltage terminal	- Pch: CMOS type - Nch: Medium sink current type	- CMOS output type or Nch OD output type	
PD0/CMP0 PD1/CMP1 PD2/CMP2 PD3/CMP3 /PGM	I	Input port pins PD0 to PD3 - These four pins can be programmed for comparator inputs in user application programs. PD0 Input will be compared with VREF0. Other inputs will be compared with VREF1. Please note that there are four comparators available in this system and these four comparators are grouped into two (one group: CMP0 and CMP1, the other group: CMP2 and CMP3), and that the comparators must be selected in group units.			EPROM control signal inputs (PGM)
PE0/TRA/CE PE1/TRB/OE	I	Input port pins PE0 to PE1 - These two tri-state input port pins can be controlled in your application programs.			EPROM control signal inputs (OE and CE)
OSC1 OSC2	I O	Pins for connecting system clock oscillator externally. If external clock source mode is to be employed, use the OSC1 pin only for clock input. Leave the other pin open.			- Ceramic resonator oscillation, RC oscillation or external clock source
RES	I	Input port pin for system reset request signal - To initialize the CPU, the RES (active low) pin level must be L with the P33/HOLD pin level = H.			
TEST/VPP	I	Input port pin for CPU test signal This pin should be connected with the VSS pin when this device is in operation.			Vpp
VDD Vss		Power supply pin			

Remarks:

Pu MOS type output

--- Pch MOS type transistor acts as a pull-up resistor when data is output.

CMOS type output

--- Pch MOS type transistor does not act as a pull-up resistor when data is output. Instead, it forms a complementary-symmetry MOS output circuit with an Nch MOS type transistor.

OD output

--- Open drain output type

Note:

At the system reset, the pin output level of each of input/output port pins will be "Floating" except for such pins as ports 0, 1. The output level of these exceptions can be specified by the user options. In addition to this system reset operation, the port output type will be set to open drain at the system reset, which is irrespective of user option specification. In this case, there is no exception. (P0, P1 are provided with pull-up resistor.)

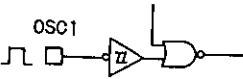

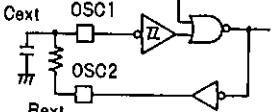

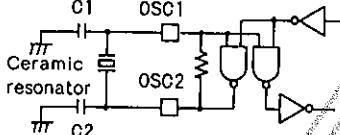

User options

1. Option for specifying the output level of ports 0, 1 at the system reset

The output level of ports 0, 1 at the system reset can be selected from the following two optional levels by the user option. In this case, it should be kept in mind that the output levels of all the four bits of each input/output port are specified at the same time.

Option name	Condition
1. "H" output level	In 4-bit units
2. "L" output level	In 4-bit units

2. Option for selecting oscillation circuit

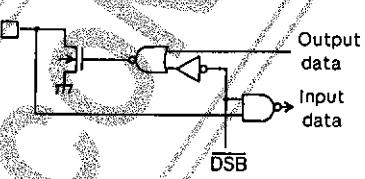

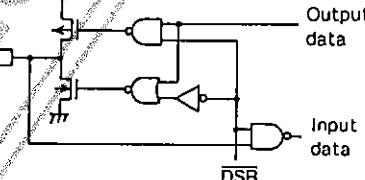

Option name	Selectable oscillation circuit	Condition
1. External clock source		- Schmitt trigger input
2. 2-pin (OSC1 and OSC2) RC oscillation circuit		- Schmitt trigger input
3. Ceramic resonator oscillation circuit		

(3) Option for selecting watchdog timer function

This option permits the user to select the watchdog timer function. This function could be helpful in detecting a timeout error from your user application program.

(4) Option for specifying port output type

- i) This option permits the user to select a desired port output type of the following ports from the two output types listed in the table below. Please note that port output types can be specified in bit units.
Ports: P0, P1, P2, P3 (P33/HOLD not included), P4, P5, P6, and PC

Option name	Selected output circuit type	Conditions
1. Open drain output type		Ports P2, P3, P5 and P6 employ schmitt trigger input.
2. Pull-up transistor output type		Ports P2, P3, P5 and P6 employ schmitt trigger input. The Pch type MOS transistor can act as either a pull-up resistor (for Pu MOS output circuit) or an output transistor (CMOS output circuit), which depends on its driving capability. CMOS output type: P2, P3, P6, and PC. Pu MOS output: P0, P1, P4, P5.

How to write data in the user option specification area and the program area in the on-chip EPROM

(1) Writing option codes to the user option specification area

Use the cross assembler "LC663S.EXE" when you write option codes in the user specification area and use the CPU pseudo instruction to set a Type No. to be evaluated and assemble your source application program. When your source application program is assembled, the option data will be stored in the user option specification area (2000 through 2007H). In addition to the above writing, you are allowed to write option data directly into the user option specification area in the on-chip EPROM. In this case, making references to the option code specification list on the next page will be a "must".

(2) Writing program into the on-chip EPROM program area

An EPROM writer available on your local market can be used to write program into the on-chip EPROM program area. In this case, the EPROM writer (27128 EPROM writer) must be used together with the dedicated writer board (W66EP308D) because the pin conversion (42 into 28) is required. The dedicated writer board is shown below.

The addresses should be set to 0000 to 2007H. If program is written mistakenly in 2008H onward, program may not be written/read normally.

Please note that the EPROM writer must be either an ADVANTEST product or the EVA850/800 accessory writer. Such an EPROM writer enables you to write your application program into the EPROM in Intel high-speed writing method.

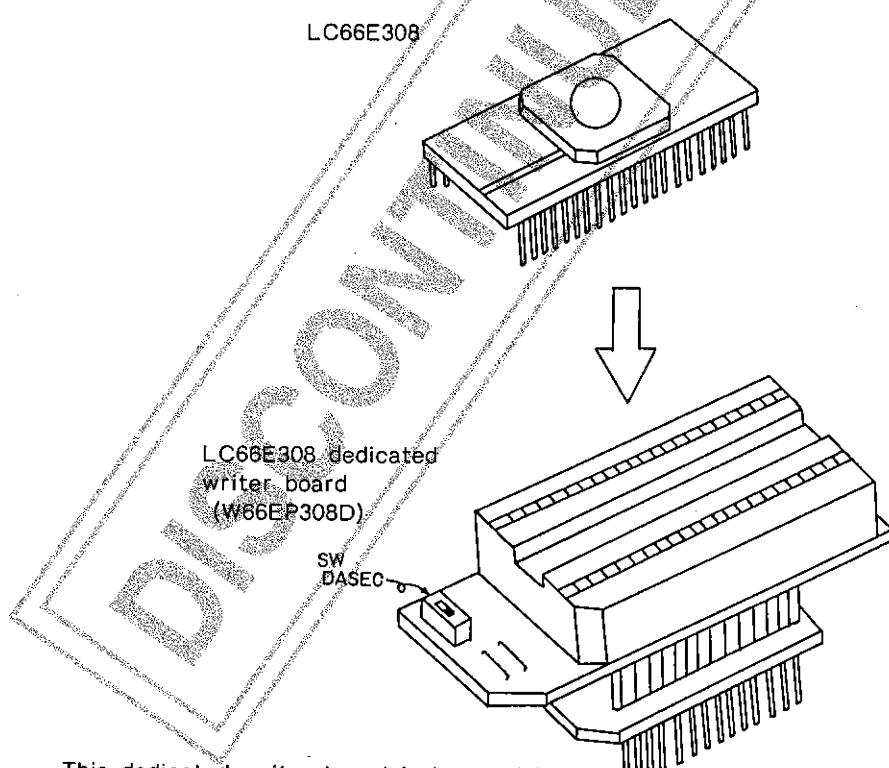

When writing program, turn OFF switch DASEC on the writer board. If turned ON, program cannot be written/read normally.

(3) Using the data security function

When switch DASEC on the writer board is turned ON and the EPROM writer can be used for writing, the execution of the data security function is initiated and data output is brought to floating state thereafter (the error message appears on the EPROM writer, because the data security function is in operation. There is noting wrong with the LC66E308 or EPROM writer.) Erasing with ultraviolet ray makes it possible to write/read program again.

(4) How to erase the contents of the on-chip EPROM

To erase the contents of the on-chip EPROM, you can use an EPROM eraser available on your local market.

This dedicated writer board is inserted into the EPROM writer available on your local market. (select either an ADVANTEST writer product or the EVA850/800 accessory EPROM writer).

Option code specification list

ROM address	Bit	Optional item	Option data and selections
2000H	7	Unused	Always set to "0".
	6		
	5	Oscillation circuit type	1: Ceramic resonator oscillation. 0: RC oscillation or external clock source
	4		
	3	Unused	Always set to "0".
	2	P1	1 = "H"-level 0 = "L"-level
	1	P0	
2001H	0	Watchdog timer function option	1: Selected, 0: Not selected.
	7	Output circuit type	1 = PU, 0 = OD
	6		
	5		
	4	Output circuit type	1 = PU, 0 = OD
	3		
	2		
	1		
2002H	0	P00	
	7	Unused	Always set to "0".
	6		
	5	Output circuit type	1 = PU, 0 = OD
	4		
	3		
	2	Output circuit type	1 = PU, 0 = OD
	1		
	0		
2003H	7	Output circuit type	1 = PU, 0 = OD
	6		
	5		
	4		
	3	Output circuit type	1 = PU, 0 = OD
	2		
	1		
	0		
2004H	7	Unused	Always set to "0".
	6		
	5		
	4		
	3	Output circuit type	1 = PU, 0 = OD
	2		
	1		
	0	P60	
2005H	7 ~ 0	Unused	Always set to "0".
2006H	7 ~ 0	Unused	Always set to "0".
2007H	7	Unused	Always set to "0".
	6		
	5		
	4		
	3	PC3	Output circuit type
	2	PC2	
	1	Unused	Always set to "0".
	0		

Remarks:

PU --- Pull-up MOS type resistance output

OD --- Open drain output

(1) Absolute maximum ratings ($T_a = 25^\circ\text{C}$ and $V_{SS} = 0\text{V}$)

Characteristic	Symbol	Pins applicable and related information	Condition	Limits	Unit	Note
Supply voltage range	V_{DD} max	V_{DD}		-0.3~+7.0	V	
Input voltage range	$V_{IN}(1)$	P2, P3, (except P33/HOLD), P4, P5 and P6.		-0.3~+15.0	V	1
	$V_{IN}(2)$	All the pins other than the above		-0.3~ $V_{DD} + 0.3$	V	2
Output voltage range	$V_{OUT}(1)$	P2, P3 (except P33/HOLD), P4, P5 and P6.		-0.3~+15.0	V	1
	$V_{OUT}(2)$	All the pins other than the above.		-0.3~ $V_{DD} + 0.3$	V	2
Output current per pin	$I_{ON}(1)$	P0, P1, P2, P3 (except P33/HOLD), P4, P5, P6 and PC.		20	mA	3
	$-I_{OP}(1)$	P0, P1, P4, P5,		2	mA	4
	$-I_{OP}(2)$	P2, P3 (except P33/HOLD), P6 and PC.		4	mA	4
Pin total current	$\Sigma I_{ON}(1)$	P0, P1, P2, P3 (except P33/HOLD), P40 and P41.		75	mA	3
	$\Sigma I_{ON}(2)$	P5, P6, P42, P43 and PC.		75	mA	3
	$-\Sigma I_{OP}(1)$	P0, P1, P2, P3 (except P33/HOLD), P40 and P41.		25	mA	4
	$-\Sigma I_{OP}(2)$	P5, P6, P42, P43 and PC.		25	mA	4
Allowable power dissipation	P_d	$T_a = +10 \sim +40^\circ\text{C}$	DIC42S	600	mW	
Operating temperature range	T_{opr}			+10~+40	°C	
Storage temperature range	T_{stg}			-55~+125	°C	

Note 1: Applicable only to the pins with open drain output circuit. Otherwise, refer to the values listed in the "all the pins other than the above" column.

Note 2: As far as oscillation input and output are concerned, the voltage range can cover the self-oscillating level.

Note 3: Sink current.

Note 4: Source current. Apply to the both of the pull-up output circuit and the CMOS output circuit.

(2) Allowable operating conditions ($T_a = +10^\circ\text{C}$ to $+40^\circ\text{C}$ and $V_{SS} = 0\text{V}$, unless otherwise noted)

Characteristic	Symbol	Pins applicable	Condition	Limits			Unit	Note
				$V_{DD}(\text{V})$	min	typ		
Operating supply voltage range	V_{DD}	V_{DD}			4.5	5.0	5.5	V
Memory backup voltage range	$V_{DD(H)}$	V_{DD}	With HOLD mode "ON"		1.8		5.5	V
High level input voltage	$V_{IH}(1)$	P2, P3 (except P33/HOLD), P4, P5 and P6	With output Nch transistor "OFF"	4.5~5.5	0.75 V_{DD}		+13.5	V 1
	$V_{IH}(2)$	P33/HOLD, RES, OSC1	With output Nch transistor "OFF"	4.5~5.5	0.75 V_{DD}		V_{DD}	V 2
	$V_{IH}(3)$	P0, P1, PC, PD, PE	With output Nch transistor "OFF"	4.5~5.5	0.7 V_{DD}		V_{DD}	V 3
	$V_{IH}(4)$	PE	With tri-state input mode selected	4.5~5.5	0.8 V_{DD}		V_{DD}	V

Continued on next page.

Continued from preceding page.

Characteristic	Symbol	Pins applicable	Condition	Limits				Unit	Note
				VDD(V)	min	typ	max		
Intermediate level input voltage range	VIM	PE	With tri-state input mode selected.	4.5~5.5	0.4VDD		0.6VDD	V	
In-phase input voltage range	VCMM	PD, PC2, PC3	With comparator input mode selected	4.5~5.5	1.0		VDD-1.5	V	
Low level input voltage range	VIL(1)	P2,P3 (except P33/HOLD), P5,P6 and RES. OSC1	With output Nch transistor "OFF"	4.5~5.5	Vss		0.25VDD	V	2
	VIL(2)	P33/HOLD		1.8~5.5	Vss		0.25VDD	V	
	VIL(3)	P0,P1,P4,PC, PD, PE, TEST	With output Nch transistor "OFF"	4.5~5.5	Vss		0.3VDD	V	3
	VIL(4)	PE	With tri-state input mode selected.	4.5~6.5	Vss		0.2VDD	.V	
Operating frequency (instruction cycle time)	fOP (TCYC)			4.5~5.5	0.4 (10)		4.35 (0.92)	MHz (μs)	
External clock input mode	Frequency	fext	OSC1	Please refer to Figure 1. As it shows, input clocks reach the OSC1 pin from an external clock source and the OSC2 pin should be left open. The oscillation circuit option should be "external clock input".	4.5~5.5	0.4		4.35	MHz
	Pulse width	textH textL			4.5~5.5	70		ns	
	Rise and Fall times	textR textF			4.5~5.5			30	ns
Self oscillation mode	Ceramic resonator oscillation	fCF	OSC1, OSC2	Refer to Figure 2.	4MHz	4.5~5.5		4.0	MHz
	Oscillation stabilization time period	tCFS		Refer to Figure 3.	4MHz	4.5~5.5		10	ms
	External R and C constants	Cext Rext	OSC1,OSC2	Refer to Figure 4.	4.5~5.5		100 TBD		pF kΩ

Note 1: These values apply to the case where the open drain circuit type has been specified. Note that the P33/HOLD pin is not included (refer to the values listed in V_{IH}(2) column and that the pins P2, P3 and P6 cannot be used as the input pins as far as the CMOS output circuit type has been employed.

Note 2: These values apply to the case where the open drain circuit type has been selected.

Note 3: When the pin PE has been selected as the tri-state input pin, the values listed in the V_{IH}(4), V_{IM} and V_{IL}(4) columns should apply to the pin. Note that the pin PC cannot be used as the input pin as far as the CMOS type output circuit has been employed.

(3) Electrical characteristics ($T_a = +10^\circ\text{C}$ to $+40^\circ\text{C}$ and $V_{SS} = 0V$, unless otherwise noted)

Characteristic	Symbol	Pins applicable	Condition	Limits			Unit	Note
				V _{DD} (V)	min	typ		
High level input current	I _{IH(1)}	P2,P3 (except P33/HOLD), P4, P5 and P6.	V _{IN} =13.5V With output Nch transistor "OFF"	4.5~5.5			5.0	μA 1
	I _{IH(2)}	P0,P1,OSC1,RES and P33/HOLD1.	V _{IN} =V _{DD} With output Nch transistor "OFF"	4.5~5.5			1.0	μA 1

Note 1: Applicable to the case where input/output common ports have been set to open drain output circuit type and the output Nch transistors have been in OFF state. Note that the input/output common ports cannot be used as the input port if they have been set to the CMOS output circuit type.

Note 2: Applicable to the case where input/output common ports have been set to open drain output circuit type and the output Nch transistors have been in OFF state. If the pull-up transistor output circuit type has been employed, please refer to the value listed in the output pull-up current column (IPO). Note that input/output common ports cannot be used as the input ports if they have been set to the CMOS output circuit type.

Note 3: Applicable to the case where the ports have been set to the CMOS output circuit type and the output Nch transistors have been in OFF state.

Note 4: Applicable to the case where the ports have been set to the pull-up resistor output circuit type and the output Nch transistors have been in OFF state.

Note 5: Applicable to the case where the ports have been set to the open drain output circuit type and the output Nch transistors have been in OFF state.

Note 6: Reset mode.

Figure 6. Timing load

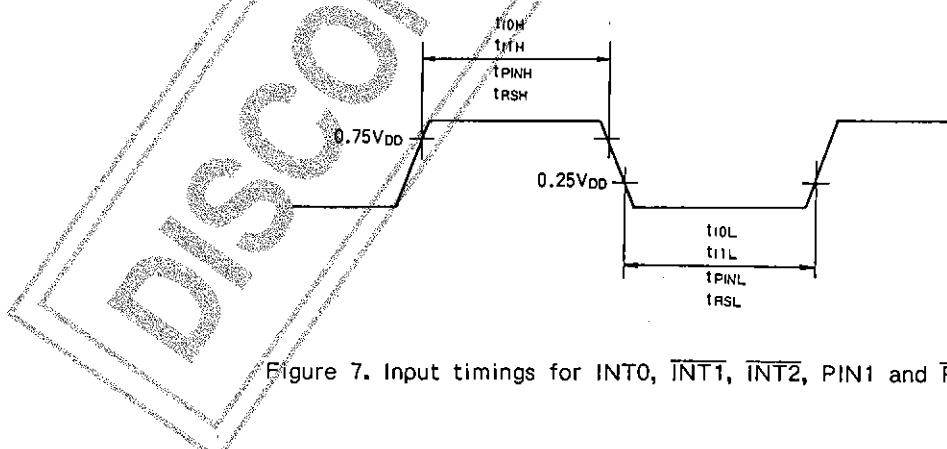

Figure 7. Input timings for INT0, INT1, INT2, PIN1 and RES

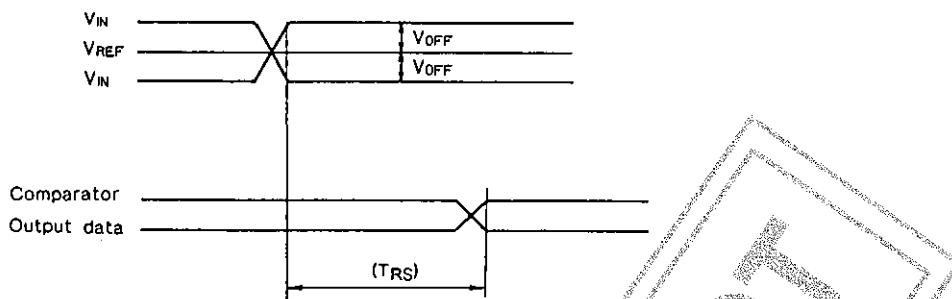

Figure 8. Comparator response speed (TR_s) and output timing**LC66E308 RC oscillation characteristics**

Figure 9 shows the RC oscillation characteristics of the LC66E308 microcomputer.

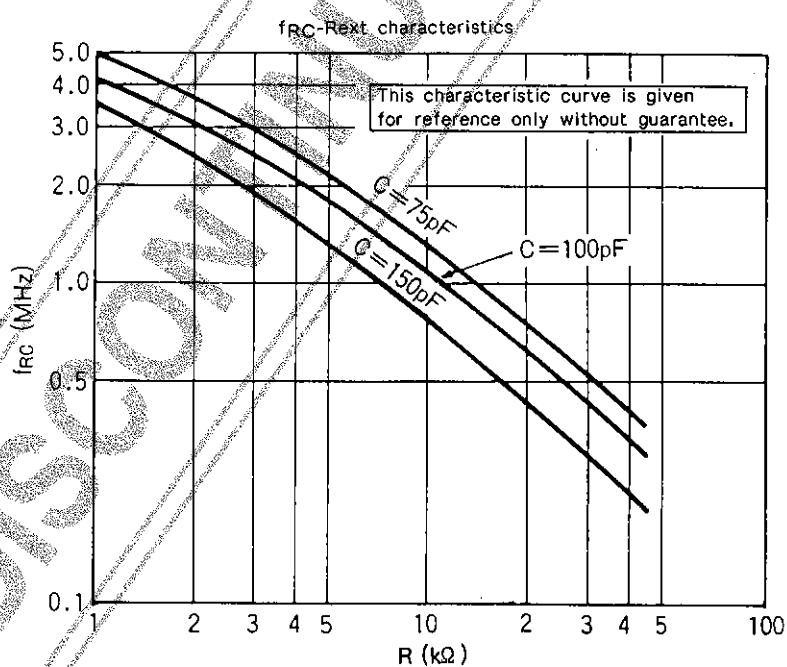

The RC oscillation frequency range that can be guaranteed is shown below with the external constants and other conditions:

$$T.B.D \leq f_{RC} \leq T.B.D$$

External constants --- Cext = 100pF and Rext = TBD
 $T_a = +10^{\circ}\text{C}$ to $+40^{\circ}\text{C}$ and $V_{DD} = 4.5\text{V}$ to 5.5V

If you are to employ the external constants other than the above, the Rext and the Cext should be within the range between T.B.D kΩ and T.B.D kΩ, and between T.B.D pF and T.B.D pF, respectively. Please take a close look at the figure below.

Note 10: With $V_{DD} = 4.5\text{V}$ to 5.5V and $T_a = +10^{\circ}\text{C}$ to $+40^{\circ}\text{C}$, the oscillation frequency to be selected should meet the requirement that the operating frequencies in the range between 0.4MHz and 4.3MHz must be provided without fail.

These values shown here are not guarantees nor recommendations. Instead, they are referencing values. It is well understood among designers that these values are strongly dependent on the application and its requirements. In any case, their suitability should be verified by environment testing before the design is submitted to production.

Figure 9. RC oscillation frequency reference values

LC6630X SERIES INSTRUCTION SET (BY FUNCTION)

Symbol	Description
AC	: Accumulator
E	: E register
CF	: Carry flag
ZF	: Zero flag
HL	: Data pointer DPH, DPL
XY	: Data pointer DPX, DPY
M	: Data memory
M (HL)	: Data memory contents specified by data pointer DPH, DPL
M (XY)	: Data memory contents specified by supplementary data pointer DPX, DPY
M2 (HL)	: 2-word data memory contents specified by data pointer DPH, DPL. In this case, the accessed data memory area address must be multiples of 2 (even address).
SP	: Stack pointer
M2 (SP)	: 2-word data memory contents specified by stack pointer
M4 (SP)	: 4-word data memory contents specified by stack pointer
in	: n-bit immediate data
t2	: Bit specification

t2	11	10	01	00
Bit	2^3	2^2	2^1	2^0

PCh	: Bits 8 to 11 of PC
PCm	: Bits 4 to 7 of PC
PCI	: Bits 0 to 3 of PC
Fn	: User's flag $n=0$ to 15
TIMER0	: Timer 0
TIMER1	: Timer 1
SIO	: Serial register
P	: Port
P (i4)	: Port contents specified by 4-bit immediate data
INT	: Interrupt enable flag
(), []	: Contents
\leftarrow	: Transfer direction and operation result
∇	: Exclusive logical sum
\wedge	: Logical product
\vee	: Logical sum
$+$: Addition
$-$: Subtraction
\sim	: 1's complement

Instruction type	Mnemonics	Instruction code		Bytes	Cycles	Function	Description	Status flags affected	Remarks	
		D ₇ D ₆ D ₅ D ₄	D ₃ D ₂ D ₁ D ₀							
Accumulator manipulation instructions	CLA	Clear AC	1 0 0 0	0 0 0 0	1	1	AC→0 (Equivalent to LAI 0)	Clears AC.	ZF	Only the first byte is effective if executed sequentially like function.
	DAA	Decimal adjust AC in addition	1 1 0 0 0 0 1 0	1 1 1 1 0 1 1 0	2	2	AC←(AC)+6 (Equivalent to ADI 6)	Adds 6 to AC.	ZF	
	DAS	Decimal adjust AC in subtraction	1 1 0 0 0 0 1 0	1 1 1 1 1 0 1 0	2	2	AC←(AC)+10 (Equivalent to ADI DAH)	Adds 10 to AC.	ZF	
	CLC	Clear CF	0 0 0 1	1 1 1 0	1	1	CF→0	Clears CF.	CF	
	STC	Set CF	0 0 0 1	1 1 1 1	1	1	CF→1	Sets CF.	CF	
	CMA	Complement AC	0 0 0 1	1 0 0 0	1	1	AC←(AC)	Gives 1's complement of (invert) AC.	ZF	
	IA	Increment AC	0 0 0 1	0 1 0 0	1	1	AC←(AC)+1	Adds 1 to AC.	ZF, CF	
	DA	Decrement AC	0 0 1 0	0 1 0 0	1	1	AC←(AC)-1	Subtracts 1 from AC.	ZF, CF	
	RAR	Rotate AC right through CF	0 0 0 1	0 0 0 0	1	1	AC _n ←(CF), AC _{n-1} ←(AC _n), CF←(AC _n)	Rotates AC right through CF.	CF	
	RAL	Rotate AC left through CF	0 0 0 0	0 0 0 1	1	1	AC ₀ ←(CF), AC _{n-1} ←(AC ₀), CF←(AC ₀)	Rotates AC left through CF.	CF, ZF	
	TAE	Transfer AC to E	0 1 0 0	0 1 0 1	1	1	E←(AC)	Transfers the AC contents to the E register.		
Memory manipulation instructions	TEA	Transfer E to AC	0 1 0 0	0 1 1 0	1	1	AC←(E)	Transfers the E register contents to AC.	ZF	
	XAE	Exchange AC with E	0 1 0 0	0 1 0 0	1	1	(AC)←(E)	Exchanges the contents of the AC and E register.		
	IM	Increment M	0 0 0 1	0 0 1 0	1	1	M(HL)←(M(HL))+1	Adds 1 to M(HL).	ZF, CF	
	DM	Decrement M	0 0 1 0	0 0 1 0	1	1	M(HL)←(M(HL))-1	Subtracts 1 from M(HL).	ZF, CF	
	IMDR i8	Increment M direct	1 1 0 0 l ₇ l ₆ l ₅ l ₄	0 1 1 1 l ₃ l ₂ l ₁ l ₀	2	2	M(i8)←[M(i8)]+1	Adds 1 to M(i8).	ZF, CF	
	DMDR i8	Decrement M direct	1 1 0 0 l ₇ l ₆ l ₅ l ₄	0 0 1 1 l ₃ l ₂ l ₁ l ₀	2	2	M(i8)←[M(i8)]-1	Subtracts 1 from M(i8).	ZF, CF	
Operation/Comparison instructions	SMB t2	Set M data bit	0 0 0 0	1 1 t ₁ t ₀	1	1	[M(HL)]t ₂ ←1	Sets a bit specified by t ₁ t ₀ of M(HL).		
	RMB t2	Reset M data bit	0 0 1 0	1 1 t ₁ t ₀	1	1	[M(HL)]t ₂ ←0	Resets a bit specified by t ₁ t ₀ of M(HL).	ZF	
	AD	Add M to AC	0 0 0 0	0 1 1 0	1	1	AC←(AC)+(M(HL))	Adds together the contents of AC and M(HL) in binary and stores the result in AC.	ZF, CF	
	ADDR i8	Add M direct to AC	1 1 0 0 l ₇ l ₆ l ₅ l ₄	1 0 0 1 l ₃ l ₂ l ₁ l ₀	2	2	AC←(AC)+(M(i8))	Adds together the contents of AC and M(i8) in binary and stores the result in AC.	ZF, CF	
	ADC	Add M to AC with CF	0 0 0 0	0 0 1 0	1	1	AC←(AC)+(M(HL))+(CF)	Adds together the contents of AC, M(HL), and CF in binary and stores the result in AC.	ZF, CF	
	ADI i4	Add immediate data to AC	1 1 0 0 0 0 1 0	1 1 1 1 l ₃ l ₂ l ₁ l ₀	2	2	AC←(AC)+l ₃ , l ₂ , l ₁ , l ₀	Adds together the contents of AC and immediate data in binary and stores the result in AC.	ZF	
	SUBC	Subtract AC from M with CF	0 0 0 1	0 1 1 1	1	1	AC←(M(HL))-(AC)-(CF)	Subtracts the contents of AC from M(HL) with CF in binary and stores the result in AC.	ZF, CF	CF=0 if there is a borrow while CF=1 if there is no borrow.
	ANDA	AND M with AC then store AC	0 0 0 0	0 1 1 1	1	1	AC←(AC)∧(M(HL))	Performs a logical AND operation between AC and M(HL) and stores the result in AC.	ZF	
	ORA	OR M with AC then store AC	0 0 0 0	0 1 0 1	1	1	AC←(AC)V(M(HL))	Performs a logical OR operation between AC and M(HL) and stores the result in AC.	ZF	
	EXL	Exclusive OR M with AC then store AC	0 0 0 1	0 1 0 1	1	1	AC←(AC)⊕(M(HL))	Performs a logical exclusive OR operation between AC and M(HL) and stores the result in AC.	ZF	
	ANDM	AND M with AC then store M	0 0 0 0	0 0 1 1	1	1	M(HL)←(AC)∧(M(HL))	Performs a logical AND operation between AC and M(HL) and stores the result in M(HL).	ZF	
	ORM	OR M with AC then store M	0 0 0 0	0 1 0 0	1	1	M(HL)←(AC)V(M(HL))	Performs a logical OR operation between AC and M(HL) and stores the results in M(HL).	ZF	

Instruction type	Mnemonics	Instruction code		Bytes	Cycles	Function	Description		Status flags affected	Remarks
		D ₇ D ₆ D ₅ D ₄	D ₃ D ₂ D ₁ D ₀				CF	ZF		
Operation/Comparison instructions	CM	Compare AC with M	0 0 0 1	0 1 1 0	1	1	(M(HL)) + (AC) + I	Compares the contents of AC and M(HL) and then sets/resets the carry flag (CF) and zero flag (ZF).	ZF, CF	
	CI i4	Compare AC with immediate data	1 1 0 0 1 0 1 0	1 1 1 1 I ₃ I ₂ I ₁ I ₀	2	2	I ₃ I ₂ I ₁ I ₀ + (AC) + I	Compares the contents of the accumulator (AC) and immediate data [I3I2I1I0] and sets/resets the zero flag (ZF) and carry flag (CF).	ZF, CF	
	CLI i4	Compare DPL with immediate data	1 1 0 0 1 0 1 1	1 1 1 1 I ₃ I ₂ I ₁ I ₀	2	2	ZF ← 1 if(DPL) = I ₃ I ₂ I ₁ I ₀ ZF ← 0 if(DPL) ≠ I ₃ I ₂ I ₁ I ₀	Compares the contents of DPL and immediate data and sets the zero flag (ZF) if they are equal, or resets the flag if not equal.	ZF	
	CMB t2	Compare AC bit with M data bit	1 1 0 0 1 1 0 1	1 1 1 1 0 0 I ₁ I ₀	2	2	ZF ← 1 if(AC, I ₂) = (M(HL), I ₂) ZF ← 0 if(AC, I ₂) ≠ (M(HL), I ₂)	Compares the contents of AC and M(HL) bit specified by the 2 bits (I1 and I2) of the instruction and sets the zero flag (ZF) if they are equal, or resets the flag if not equal.	ZF	
Load/store instructions	LAE	Load AC and E from M2(HL)	0 1 0 1	1 1 0 0	1	1	AC ← M(HL) E ← M(HL+1)	Loads the contents of M2(HL) into the AC and the E register.		
	LAI i4	Load AC with immediate data	1 0 0 0	I ₃ I ₂ I ₁ I ₀	1	1	AC ← I ₃ I ₂ I ₁ I ₀	Loads immediate data into AC.	ZF	Only the first instruction in a block of continuously issued functions
	LADR i8	Load AC from M direct	1 1 0 0 I ₇ I ₆ I ₅ I ₄	0 0 0 1 I ₃ I ₂ I ₁ I ₀	2	2	AC ← (M(i8))	Loads the contents of M(i8) into AC.	ZF	
	S	Store AC to M	0 1 0 0	0 1 1 1	1	1	M(HL) ← (AC)	Stores the contents of AC into M(HL).		
	SAE	Store AC and E to M2(HL)	0 1 0 1	I ₁ I ₀ 0	1	1	M(HL) ← (AC) M(HL+1) ← (E)	Stores the contents of AC and the E register into M2(HL).		
	LA reg	Load AC from M(reg)	0 1 0 0	I 0 I ₀ 0	1	1	AC ← (M(reg))	Loads the contents of M(reg) into AC. reg is either an HL or XY.	ZF	
	LA reg, I	Load AC from M(reg) then increment reg	0 1 0 0	I 0 I ₀ 1	1	2	AC ← (M(reg)) DPL ← (DPL) + 1 or DPY ← (DPY) + 1	Loads the contents of M(reg) into the accumulator (AC). reg is either an HL or XY. After loading, increments the contents of DPL or DPY. Refer to the LA reg instruction for the relationship between reg and t0.	ZF	ZF status depends on DPL or DPY increment result.
	LA reg, D	Load AC from M(reg) then decrement reg	0 1 0 1	I 0 I ₀ 1	1	2	AC ← (M(reg)) DPL ← (DPL) - 1 or DPY ← (DPY) - 1	Loads the contents of M(reg) into AC. reg is either an HL or XY. After loading, decrements the contents of DPL or DPY. Refer to the LA reg instruction for the relationship between reg and t0.	ZF	ZF status depends on DPL or DPY decrement result.
	XA reg	Exchange AC with M(reg)	0 1 0 0	I 1 I ₀ 0	1	1	(AC) ↔ (M(reg))	Exchanges the contents of AC and M(reg). reg is either an HL or XY.		
	XA reg, I	Exchange AC with M(reg) then increment reg	0 1 0 0	I 1 I ₀ 1	1	2	(AC) ↔ (M(reg)) DPL ← (DPL) + 1 or DPY ← (DPY) + 1	Exchanges the contents of AC and M(reg). reg is either an HL or XY. After exchanging, increments the contents of DPL or DPY. Refer to the XA reg instruction for the relationship between reg and t0.	ZF	ZF status depends on DPL or DPY increment result.
	XA reg, D	Exchange AC with M(reg) then decrement reg	0 1 0 1	I 1 I ₀ 1	1	2	(AC) ↔ (M(reg)) DPL ← (DPL) - 1 or DPY ← (DPY) - 1	Exchanges the contents of AC and M(reg). reg is either an HL or XY. After exchanging, decrements the contents of DPL or DPY. Refer to the XA reg instruction for the relationship between reg and t0.	ZF	ZF status depends on DPL or DPY decrement result.
	XADR i8	Exchange AC with M direct	1 1 0 0 I ₇ I ₆ I ₅ I ₄	I 0 0 0 I ₃ I ₂ I ₁ I ₀	2	2	(AC) ↔ (M(i8))	Exchanges the contents of AC and M(i8).		

Instruction type	Mnemonics	Instruction code		Bytes	Cycles	Function	Description	Status flags affected	Remarks
		D ₇ D ₆ D ₅ D ₄	D ₃ D ₂ D ₁ D ₀						
Load/store instructions	LEAI i8 Load E & AC with immediate data	1 1 0 0 I ₇ I ₆ I ₅ I ₄	0 1 1 0 I ₃ I ₂ I ₁ I ₀	2	2	E → I ₇ I ₆ I ₅ I ₄ AC → I ₃ I ₂ I ₁ I ₀	Loads immediate data i8 into the E register and the accumulator (AC).		
	RTBL Read table data from program ROM	0 1 0 1	1 0 1 0	1	2	E,AC—(ROM(PCh,E,AC))	First, replace the contents of lower 8 bits of PC with the E register and AC contents. Then, loads the ROM data at an address specified by the new contents of the lower 8 bits of PC into the E register and AC.		
	RTBLP Read table data from program ROM then output to P4,5	0 1 0 1	1 0 0 0	1	2	Port 4,5—(ROM(PCh,E,AC))	First, replace the contents of lower 8 bits of AC with the E register and AC contents. Then, outputs the ROM data at an address specified by the new contents of the lower 8 bits of PC to port 4 and 5.		
	LDZ i4 Load DP _H with zero and DP _L with immediate data respectively	0 1 1 0	I ₃ I ₂ I ₁ I ₀	1	1	DP _H →0 DP _L →I ₃ I ₂ I ₁ I ₀	Loads the data of 0 (zero) and immediate data i4 into the DP _H and DP _L respectively.		
	LHI i4 Load DP _H with immediate data	1 1 0 0 0 0 0 0	I ₃ I ₂ I ₁ I ₀	2	2	DP _H →I ₃ I ₂ I ₁ I ₀	Loads immediate data i4 into the DP _H .		
	LLI i4 Load DP _L with immediate data	1 1 0 0 0 0 0 1	I ₃ I ₂ I ₁ I ₀	2	2	DP _L →I ₃ I ₂ I ₁ I ₀	Loads immediate data i4 into the DP _L .		
	LHLI i8 Load DP _H , DP _L with immediate data	1 1 0 0 I ₇ I ₆ I ₅ I ₄	0 0 0 0 I ₃ I ₂ I ₁ I ₀	2	2	DP _H →I ₇ I ₆ I ₅ I ₄ DP _L →I ₃ I ₂ I ₁ I ₀	Loads immediate data into the DP _H and DP _L .		
	LXYI i8 Load DP _X , DP _Y with immediate data	1 1 0 0 I ₇ I ₆ I ₅ I ₄	0 0 1 0 I ₃ I ₂ I ₁ I ₀	2	2	DP _X →I ₇ I ₆ I ₅ I ₄ DP _Y →I ₃ I ₂ I ₁ I ₀	Loads immediate data into the DP _X and DP _Y .		
	IL Increment DP _L	0 0 0 1	0 0 0 1	1	1	DP _L →(DP _L) + 1	Increments the contents of the DP _L by 1.	ZF	
	DL Decrement DP _L	0 0 1 0	0 0 0 1	1	1	DP _L →(DP _L) - 1	Decrements the contents of the DP _L by 1.	ZF	
Data pointer manipulation instructions	IY Increment DP _Y	0 0 0 1	0 0 1 1	1	1	DP _Y →(DP _Y) + 1	Increments the contents of the DP _Y by 1.	ZF	
	DY Decrement DP _Y	0 0 1 0	0 0 1 1	1	1	DP _Y →(DP _Y) - 1	Decrements the contents of the DP _Y by 1.	ZF	
	TAH Transfer AC to DP _H	1 1 0 0 1 1 1 1	1 1 1 1 0 0 0 0	2	2	DP _H →(AC)	Transfers the contents of the accumulator (AC) to the DP _H .		
	THA Transfer DP _H to AC	1 1 0 0 1 1 1 0	1 1 1 1 0 0 0 0	2	2	AC→(DP _H)	Transfers the contents of the DP _H to the AC.	ZF	
	XAH Exchange AC with DP _H	0 1 0 0	0 0 0 0	1	1	(AC)→(DP _H)	Exchanges the contents of the accumulator (AC) and the DP _H .		
	TAL Transfer AC to DP _L	1 1 0 0 1 1 1 1	1 1 1 1 0 0 0 1	2	2	DP _L →(AC)	Transfers the contents of the accumulator (AC) to the DP _L .		
	TLA Transfer DP _L to AC	1 1 0 0 1 1 1 0	1 1 1 1 0 0 0 1	2	2	AC→(DP _L)	Transfers the contents of the DP _L to the accumulator (AC).	ZF	
	XAL Exchange AC with DP _L	0 1 0 0	0 0 0 1	1	1	(AC)→(DP _L)	Exchanges the contents of the AC and DP _L .		
	TAX Transfer AC to DP _X	1 1 0 0 1 1 1 1	1 1 1 1 0 0 1 0	2	2	DP _X →(AC)	Transfers the contents of the accumulator (AC) to the DP _X .		
	TXA Transfer DP _X to AC	1 1 0 0 1 1 1 0	1 1 1 1 0 0 1 0	2	2	AC→(DP _X)	Transfers the contents of DP _X to the AC.	ZF	
Flag manipulation instructions	XAX Exchange AC with DP _X	0 1 0 0	0 0 1 0	1	1	(AC)→(DP _X)	Exchanges the contents of the AC and DP _X .		
	TAY Transfer AC to DP _Y	1 1 0 0 1 1 1 1	1 1 1 1 0 0 1 1	2	2	DP _Y →(AC)	Transfers the contents of the accumulator (AC) to the DP _Y .		
	TYA Transfer DP _Y to AC	1 1 0 0 1 1 1 0	1 1 1 1 0 0 1 1	2	2	AC→(DP _Y)	Transfers the contents of the DP _Y to the AC.	ZF	
Jump/subroutine instructions	XAY Exchange AC with DP _Y	0 1 0 0	0 0 1 1	1	1	(AC)→(DP _Y)	Exchanges the contents of the AC and DP _Y .		
	JMP addr Jump in the current bank	1 1 1 0	P ₁ P ₁₀ P ₉ P ₈ P ₇ P ₆ P ₅ P ₄	2	2	PC12→PC12 PC11→...P ₁₁ →P ₀	Jumps to an address specified by immediate data P ₁₁ → P ₀ in the current bank.	When executed immediately after the BANK instruction, PC12→PC12.	
	JPEA Jump to the address stored at E and AC in the current page	0 0 1 0	0 1 1 1	1	1	PC12→PC8→PC12→ PC8→PC7~4→(E) PC3→0→(AC)	Jumps to an address specified by the contents of the E register and accumulator (AC) which have replaced the contents of lower 8 bits of the program counter (PC).		

Instruction type	Mnemonics	Instruction code		Bytes	Cycles	Function	Description	Status flags affected	Remarks
		D ₇ D ₆ D ₅ D ₄	D ₃ D ₂ D ₁ D ₀						
Jump/subroutine instructions	CAL addr	Call subroutine	0 1 0 1 P ₇ P ₆ P ₅ P ₄	0 P ₃ P ₂ P ₁ P ₀	2	2	PC12~4~0 PC10~0~ P ₁₀ ~P ₀ M4(SP)~(CF, ZF, PC12~0) SP~(SP)~4	Calls a subroutine.	
	CZP addr	Call subroutine in the zero page	1 0 1 0	P ₃ P ₂ P ₁ P ₀	1	2	PC12~6, PC1~0~0 PC5~2~ P ₃ ~P ₀ M4(SP)~(CF, ZF, PC12~0) SP~SP~4	Calls a subroutine in page 0 of bank 0.	
	BANK	Change bank	0 0 0 1	1 0 1 1	1	1		Changes memory banks and register banks.	
	PUSH reg	Push reg on M2(SP)	1 1 0 0 1 1 1 1	1 1 1 1 1 i ₁₀ 0	2	2	M2(SP)~(reg) SP~(SP)~2	Stores the contents of reg into the M2(SP) and then subtracts 2 from the stack pointer (SP).	
	POP reg	Pop reg off M2(SP)	1 1 0 0 1 1 1 0	1 1 1 1 1 i ₁₀ 0	2	2	SP~(SP)~+2 reg~(M2(SP))	Loads the contents of reg into the M2(SP) and then increments the contents of the stack pointer (SP) by 2 and loads the contents of M2 (SP) into reg. Refer to the PUSH reg instruction for the relationship between i10 and reg.	
	RT	Return from subroutine	0 0 0 1	1 1 0 0	1	2	SP~(SP)~+4 PC~[M4(SP)]	Returns execution from a subroutine or interrupt processing routine back to the routine that called it. The contents of the carry flag (CF) and zero flag (ZF) are not returned from the stack area.	
	RTI	Return from interrupt routine	0 0 0 1	1 1 0 1	1	2	SP~(SP)~+4 PC~[M4(SP)] CF, ZF~[M4(SP)]	Returns execution from a subroutine or interrupt processing routine back to the routine that called it. The contents of the carry flag (CF) and zero flag (ZF) are returned from the stack area.	ZF, CF
	BAt2 addr	Branch on AC bit	1 1 0 1 P ₇ P ₆ P ₅ P ₄	0 0 t ₁ t ₀ P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(AC, t2)=1	Transfers execution to an address specified by the contents of P7 to P0 in the current page if a bit specified by immediate data t1t0 of AC is 1 (program branch).	
	BNAAt2 addr	Branch on no AC bit	1 0 0 1 P ₇ P ₆ P ₅ P ₄	0 0 t ₁ t ₀ P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(AC, t2)=0	Transfers execution to an address specified by the contents of P7 to P0 in the current page if a bit specified by immediate data t1t0 of AC is 0 (program branch).	
Branch instructions	BMt2 addr	Branch on M bit	1 1 0 1 P ₇ P ₆ P ₅ P ₄	0 1 t ₁ t ₀ P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(M(HL), t2)=1	Transfers execution to an address specified by the contents of P7 to P0 in the current page if a bit specified by immediate data t1t0 of M(HL) is 1 (program branch).	
	BNMt2 addr	Branch on no M bit	1 0 0 1 P ₇ P ₆ P ₅ P ₄	0 1 t ₁ t ₀ P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(M(HL), t2)=0	Transfers execution to an address specified by the contents of P7 to P0 in the current page if a bit specified by immediate data t1t0 of M(HL) is 0 (program branch).	
	BPt2 addr	Branch on Port bit	1 1 0 1 P ₇ P ₆ P ₅ P ₄	1 0 t ₁ t ₀ P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(P(DPL), t2)=1	Transfers execution to an address specified by the contents of P7 to P0 in the current page if a bit specified by immediate data t1t0 of the port accessed by DPL is 1 (program branch).	Used to manipulate internal control registers if executed immediately after the BANK instruction. In this case, the internal control registers must be readable.
	BNPt2 addr	Branch on no Port bit	1 0 0 1 P ₇ P ₆ P ₅ P ₄	1 0 t ₁ t ₀ P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(P(DPL), t2)=0	Transfers execution to an address specified by the contents of P7 to P0 in the current page if a bit specified by immediate data t1t0 of the port accessed by DPL is 0 (program branch).	Same as above.
	BC addr	Branch on CF	1 1 0 1 P ₇ P ₆ P ₅ P ₄	1 1 0 0 P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(CF)=1	Transfers execution to an address specified by the contents of P7 to P0 in the current page if the content of the carry flag (CF) is 1 (program branch).	
	BNC addr	Branch on no CF	1 0 0 1 P ₇ P ₆ P ₅ P ₄	1 1 0 0 P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(CF)=0	Transfers execution to an address specified by the contents of P7 to P0 in the current page if the content of the carry flag (CF) is 0 (program branch).	
	BZ addr	Branch on ZF	1 1 0 1 P ₇ P ₆ P ₅ P ₄	1 1 0 1 P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(ZF)=1	Transfers execution to an address specified by the contents of P7 to P0 in the current page if the content of the zero flag (ZF) is 1 (program branch).	
	BNZ addr	Branch on no ZF	1 0 0 1 P ₇ P ₆ P ₅ P ₄	1 1 0 1 P ₃ P ₂ P ₁ P ₀	2	2	PC7~0~ P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(ZF)=0	Transfers execution to an address specified by the contents of P7 to P0 in the current page if the content of the zero flag (ZF) is 0 (program branch).

The flag is one of the 16 flags.		
	BNFn4 addr	Branch on no flag bit	1 0 1 1 P ₇ P ₆ P ₅ P ₄	n ₃ n ₂ n ₁ n ₀ P ₃ P ₂ P ₁ P ₀	2	2	PC7~0→P ₇ P ₆ P ₅ P ₄ P ₃ P ₂ P ₁ P ₀ if(Fn)=0	Transfers execution to an address specified by the contents of P7 to P0 in the current page if the content of the flag specified by n3n2n1n0 is 0. The flag is one of the 16 flags.		
Input/output instructions	IPO	Input port 0 to AC	0 0 1 0	0 0 0 0	1	1	AC←(P0)	Inputs the contents of port 0 to the accumulator (AC).	ZF	
	IP	Input port to AC	0 0 1 0	0 1 1 0	1	1	AC←(P(DPL))	Inputs the contents of port accessed by DPL to the accumulator (AC).	ZF	
	IPM	Input port to M	0 0 0 1	1 0 0 1	1	1	M(HL)←(P(DPL))	Inputs the contents of port accessed by DPL to the M(HL).		
	IPDR i4	Input port to AC direct	1 1 0 0 0 1 1 0	1 1 1 1 I ₃ I ₂ I ₁ I ₀	2	2	AC←(P(i4))	Inputs the contents of port accessed by i4 to the accumulator (AC).	ZF	
	IP45	Input port 4,5 to E, AC respectively	1 1 0 0 1 1 0 1	1 1 1 1 0 1 0 0	2	2	E←(P(4)) AC←(P(5))	Inputs the contents of ports 4 and 5 to the E register and accumulator (AC) respectively.		
	OP	Output AC to port	0 0 1 0	0 1 0 1	1	1	P(DPL)←(AC)	Outputs the contents of the accumulator (AC) to a port accessed by DPL.		
	OPM	Output M to port	0 0 0 1	1 0 1 0	1	1	P(DPL)←(M(HL))	Outputs the contents of the M(HL) to a port accessed by DPL.		
	OPDR i4	Output AC to port direct	1 1 0 0 0 1 1 1	1 1 1 1 I ₃ I ₂ I ₁ I ₀	2	2	P(i4)←(AC)	Outputs the contents of the accumulator (AC) to a port accessed by i4.		
	OP45	Output E, AC to port 4,5 respectively	1 1 0 0 1 1 0 1	1 1 1 1 0 1 0 1	2	2	P(4)←(E) P(5)←(AC)	Outputs the contents of the E register and accumulator (AC) to ports 4 and 5 respectively.		
	SPB t2	Set port bit	0 0 0 0	1 0 t ₁ t ₀	1	1	[P(DPL), t ₂]←1	Sets a bit specified by immediate data t ₁ t ₀ of a port accessed by DPL.		
	RPB t2	Reset port bit	0 0 1 0	1 0 t ₁ t ₀	1	1	[P(DPL), t ₂]←0	Resets a bit specified by immediate data t ₁ t ₀ of a port accessed by DPL.	ZF	
Timer control instructions	ANDPDR i4, p4	AND port with immediate data then output	1 1 0 0 I ₃ I ₂ I ₁ I ₀	0 1 0 1 P ₃ P ₂ P ₁ P ₀	2	2	P(P ₃ ~P ₀)←(P(P ₃ ~P ₀))V I ₃ ~I ₀	Performs a logical AND operation between the contents of a port specified by P3 to P0 and immediate data I3I2I1I0 and outputs the resulted product to the port.	ZF	
	ORPDR i4, p4	OR port with immediate data then output	1 1 0 0 I ₃ I ₂ I ₁ I ₀	0 1 0 0 P ₃ P ₂ P ₁ P ₀	2	2	P(P ₃ ~P ₀)←[P(P ₃ ~P ₀)]V I ₃ ~I ₀	Performs a logical OR operation between the contents of a port specified by P3 to P0 and immediate data I3I2I1I0 and outputs the resulted sum to the port.	ZF	
	WTTM0	Write timer 0	1 1 0 0	1 0 1 0	1	2	TIMER0←(M2(HL)), (AC)	Writes the contents of the M(HL) and the accumulator (AC) to the timer 0 reload register.		
	WTTM1	Write timer 1	1 1 0 0 1 1 1 1	1 1 1 1 0 1 0 0	2	2	TIMER1←(E), (AC)	Writes the contents of the E register and the accumulator (AC) to the timer 1 reload register.		
	RTIMO	Read timer 0	1 1 0 0	1 0 1 1	1	2	M2(HL), AC←(TIMERO)	Reads the contents of the timer 0 counter into the M2(HL) and the accumulator (AC).		
	RTIM1	Read timer 1	1 1 0 0 1 1 1 1	1 1 1 1 0 1 0 1	2	2	E, AC←(TIMER1)	Reads the contents of the timer 1 counter into the E register and the accumulator (AC).		
	START0	Start timer 0	1 1 0 0 1 1 1 0	1 1 1 1 0 1 1 0	2	2	Start timer 0 counter	Starts the timer 0 counter operation.		
	START1	Start timer 1	1 1 0 0 1 1 1 0	1 1 1 1 0 1 1 1	2	2	Start timer1 counter	Starts the timer 1 counter operation.		
	STOP0	Stop timer 0	1 1 0 0 1 1 1 1	1 1 1 1 0 1 1 0	2	2	Stop timer 0 counter	Stops the timer 0 counter operation.		
	STOP1	Stop timer 1	1 1 0 0 1 1 1 1	1 1 1 1 0 1 1 1	2	2	Stop timer1 counter	Stops the timer 1 counter operation.
