Pin Name	Pin No.	I/O Configuration	Function
VDD	11(15)		Power supply pin.
VSS	12(16)		
XIN	9 (13)		Used to generate the reference frequency. Uses a crystal resonator of 3.579545MHz. With the feedback resistor and capacitors contained to form the OSC circuit, a crystal resonator is simply connected across the pins. When using a ceramic resonator, a capacitor of approximately 30pF must be connected to each pin.

- Even when the tone mode (P/T SW: "Tone") is entered at the OFF-HOOK state, the OUTPUT-PULSE mode can be entered (P/T SW: "Pulse").
- The output mode provided when redialing is the one provided when dialed previously (regardless of the P/T SW position when the RD key is pushed)

- The mode after completion of redialing is set again by the P/T SW position provided when redialing is completed.

Since the \overline{DP} , $\overline{MUTE1}$, $\overline{MUTE2}$, $\overline{MODE-OUT}$ outputs are of the Nch open drain type, the output transistor OFF-state ("H" impedance) provides "H" level. Likewise, since the DTMF output is of the emitter follower type, the output transistor OFF-state ("H" impedance) provides "L" level.
