Express written permission is also required before any use of this publication may be made by a third party.
- The application circuit examples in this publication are provided to explain the representative applications of Sharp devices and are not intended to guarantee any circuit design or permit any industrial property right or other rights to be executed. Sharp takes no responsibility for any problems related to any industrial property right or a third party resulting from the use of Sharp's devices, except for those resulting directly from device manufacturing processes.
- In the absence of confirmation by device specification sheets, Sharp takes no responsibility for any defects that occur in equipment using any of Sharp's devices, shown in catalogs, data books, etc. Contact Sharp in order to obtain the latest device specifications sheets before using any Sharp device.
- Sharp reserves the right to make changes in the specifications, characteristics, data, materials, structures and other contents described herein at any time without notice in order to improve design or reliability. Contact Sharp in order to obtain the latest specification sheets before using any Sharp device. Manufacturing locations are also subject to change without notice.
- Observe the following points when using any device in this publication. Sharp takes no responsibility for damage caused by improper use of devices.
 - 1 The devices in this publication are designed for use in general electronic equipment designs, such as :
 - Personal computers • Office automation • Telecommunication equipment (except for trunk lines)
 - Test and measurement equipment • Industrial control • Audio visual and multimedia equipment
 - Consumer electronics
 - 2 The appropriate design measures should be taken to ensure reliability and safety when Sharp devices are used for equipment, such as :
 - Main frame computers • Transportation control and safety equipment (i.e., aircraft, trains, automobiles, etc.)
 - Traffic signal • Gas leakage sensor breakers • Alarm equipment • Various safety devices etc.
 - 3 Sharp devices shall not be used for equipment that requires an extremely high level of reliability, such as :
 - Military and aerospace applications • Telecommunication equipment (trunk lines)
 - Nuclear power control equipment • Medical equipment for life support
- Contact a Sharp representative, in advance, when intending to use Sharp devices for any "Specific" applications other than those recommended by Sharp.
- Contact and consult with a Sharp representative if there are any questions about the contents of this publication.

LH28F400SUT-LC12
4 MBIT (512 KBIT x 8, 256 KBIT x 16)
3.3V ($V_{pp}=5V$) FLASH MEMORY

FEATURES

- 32 Independently Lockable Blocks
- 100,000 Erase Cycles per Block
- 5V Write/Erase Operation (5V V_{pp} , 3.3V V_{cc})
 - No Requirement for DC/DC Converter to Write/Erase
- User-Configurable x8 or x16 Operation
- 120 ns Maximum Access Time ($V_{cc} = 3.3V \pm 0.3V$)
- Min. 2.7V Read Capability
 - 160 ns Maximum Access Time ($V_{cc} = 2.7V$)
- Automated Byte Write/Block Erase
 - Command User Interface
 - Status Register
 - RY/BY# Status Output
- 56-Lead, 1.2mm x 14mm x 20mm TSOP Package
- System Performance Enhancement
 - Erase Suspend for Read
 - Two-Byte Write
 - Full Chip Erase
- Data Protection
 - Hardware Erase/Write Lockout during Power Transitions
 - Software Erase/Write Lockout
- Independently Lockable for Write/Erase on Each Block (Lock Block & Protect Set/Reset)
- 4 μA (Typ.) I_{cc} in CMOS Standby
- 0.2 μA (Typ.) Deep Power-Down
- State-of-the-Art 0.55 μm ETOX™ Flash Technology
- Not designed or rated as radiation hardened

Sharp's LH28F400SUT-LC12 4-Mbit Flash Memory is a revolutionary architecture which enables the design of truly mobile, high performance, personal computing and communication products. With innovative capabilities, 3.3V low power operation and very high read/write performance, the LH28F400SUT-LC12 is also the ideal choice for designing embedded mass storage flash memory systems.

The LH28F400SUT-LC12's independently lockable 32 symmetrical blocked architecture (16-Kbyte each) extended cycling, low power operation, very fast write and read performance and selective block locking provide a highly flexible memory component suitable for Cellular phone, Facsimile, Game, PC, Printer and Handy terminal. The LH28F400SUT-LC12's 5.0V/3.3V power supply operation enables the design of memory cards which can be read in 3.3V system and written in 5.0V/3.3V systems. Its x8/x16 architecture allows the optimization of memory to processor interface. The flexible block locking option enables bundling of executable application software in a Resident Flash Array or memory card. Manufactured on Sharp's 0.55 μm ETOX™ process technology, the LH28F400SUT-LC12 is the most cost-effective, high-density 3.3V flash memory.

* ETOX is a trademark of Intel corporation.

1.0 INTRODUCTION

The data sheet is intended to give an overview of the chip feature-set and of the operating AC/DC specifications.

1.1 Product Overview

The LH28F400SUT-LC12 is a high performance 4-Mbit (4,194,304 bit) block erasable non-volatile random access memory organized as either 256 Kword x 16 or 512 Kbyte x 8. The LH28F400SUT-LC12 includes thirty-two 16 KB (16,384) blocks. A chip memory map is shown in Figure 3.

The implementation of a new architecture, with many enhanced features, will improve the device operating characteristics and results in greater product reliability and ease of use.

Among the significant enhancements of the LH28F400SUT-LC12:

- 3V Read, 5V Write/Erase Operation (5V V_{PP} , 3V V_{CC})
- Low Power Capability (2.7V V_{CC} Read)
- Improved Write Performance
- Dedicated Block Write/Erase Protection
- Command-Controlled Memory Protection Set/Reset Capability

The LH28F400SUT-LC12 will be available in a 36-lead, 1.2mm thick, 14mm x 20mm TSOP type 1 package. This form factor and pinout allow for very high board layout densities.

A Command User Interface (CUI) serves as the system interface between the microprocessor or micro-controller and the internal memory operation.

Internal Algorithm Automation allows Byte Writes and Block Erase operations to be executed using a Two-Write command sequence to the CUI in the same way as the LH28F008SA 8-Mbit Flash memory.

A Superset of commands have been added to the basic LH28F008SA command-set to achieve higher write performance and provide additional capabilities. These new commands and features include:

- Software Locking of Memory Blocks
- Memory Protection Set/Reset Capability
- Two-Byte Serial Writes in 8-bit Systems
- Erase All Unlocked Blocks

Writing of memory data is performed typically within 20 μ sec per byte. Writing of memory data is performed typically within 30 μ sec per word. A Block Erase operation erases one of the 32 blocks in typically 0.8 sec, independent of the other blocks.

LH28F400SUT-LC12 allows to erase all unlocked blocks. It is desirable in case of which you have to implement Erase operation max. 32 times.

LH28F400SUT-LC12 enables Two-Byte serial Write which is operated by three times command input. Writing of memory data is performed typically within 30 μ sec per two-byte. This feature can improve 8-bit system write performance by up to typically 15 μ sec per byte.

All operations are started by a sequence of Write commands to the device. Status Register (described in detail later) and a RY/BY# output pin provide information on the progress of the requested operation.

Same as the LH28F008SA, LH28F400SUT-LC12 requires an operation to complete before the next operation can be requested, also it allows to suspend block erase to read data from any other block, and allow to resume erase operation.

The LH28F400SUT-LC12 provides user-selectable block locking to protect code or data such as Device Drivers, PCMCIA card information, ROM-Executable OS or Application Code. Each block has an associated non-volatile lock-bit which determines the lock status of the block. In addition, the LH28F400SUT-LC12 has a software controlled master Write Protect circuit which prevents any modifications to memory blocks whose lock-bits are set.

When the device power-up or RP# turns High, Write Protect Set/Confirm command must be written. Otherwise, all lock bits in the device remain being locked, can't perform the Write to each block and single Block Erase. Write Protect Set/Confirm command must be written to reflect the actual lock status. However, when the device power-on or RP# turns High, Erase All Unlocked Blocks can be used. If used, Erase is performed with reflecting actual lock status, and after that Write and Block Erase can be used.

The LH28F400SUT-LC12 contains a Compatible Status Register (CSR) which is 100% compatible with the LH28F008SA Flash memory's Status Register. This register, when used alone, provides a straightforward upgrade capability to the LH28F400SUT-LC12 from a LH28F008SA-based design.

The LH28F400SUT-LC12 incorporates an open drain RY/BY# output pin. This feature allows the user to OR-tie many RY/BY# pins together in a multiple memory configuration such as a Resident Flash Array.

The LH28F400SUT-LC12 is specified for a maximum access time of 120 nsec (t_{ACC}) at 3.3V operation (3.0 to 3.6V) over the commercial temperature range (0 to +70°C). A corresponding maximum access time of 160 nsec (t_{ACC}) at 2.7V (0 to +70°C) is achieved for reduced power consumption applications.

The LH28F400SUT-LC12 incorporates an Automatic Power Saving (APS) feature which substantially reduces the active current when the device is in static mode of operation (addresses not switching).

In APS mode, the typical I_{CC} current is 1 mA at 3.3V.

A Deep Power-Down mode of operation is invoked when the RP# (called PWD# on the LH28F008SA) pin transitions low, any current operation is aborted and the device is put into the deep power down mode. This mode brings the device power consumption to less than 5 μ A, and provides additional write protection by acting as a device reset pin during power transitions. When the power is turned on, RP# pin is turned to low in order to return the device to default configuration. When the power transition is occurred, or at the power on/off, RP# is required to stay low in order to protect data from noise. A recovery time of 620ns is required from RP# switching high until outputs are again valid. In the Deep Power-Down state, the WSM is reset (any current operation will abort) and the CSR register is cleared.

A CMOS Standby mode of operation is enabled when CE# transitions high and RP# stays high with all input control pins at CMOS levels. In this mode, the device draws an I_{CC} standby current of 8 μ A.

2.0 DEVICE PINOUT

The LH28F400SUT-LC12 58-Lead TSOP Type I pinout configuration is shown in Figure 2.

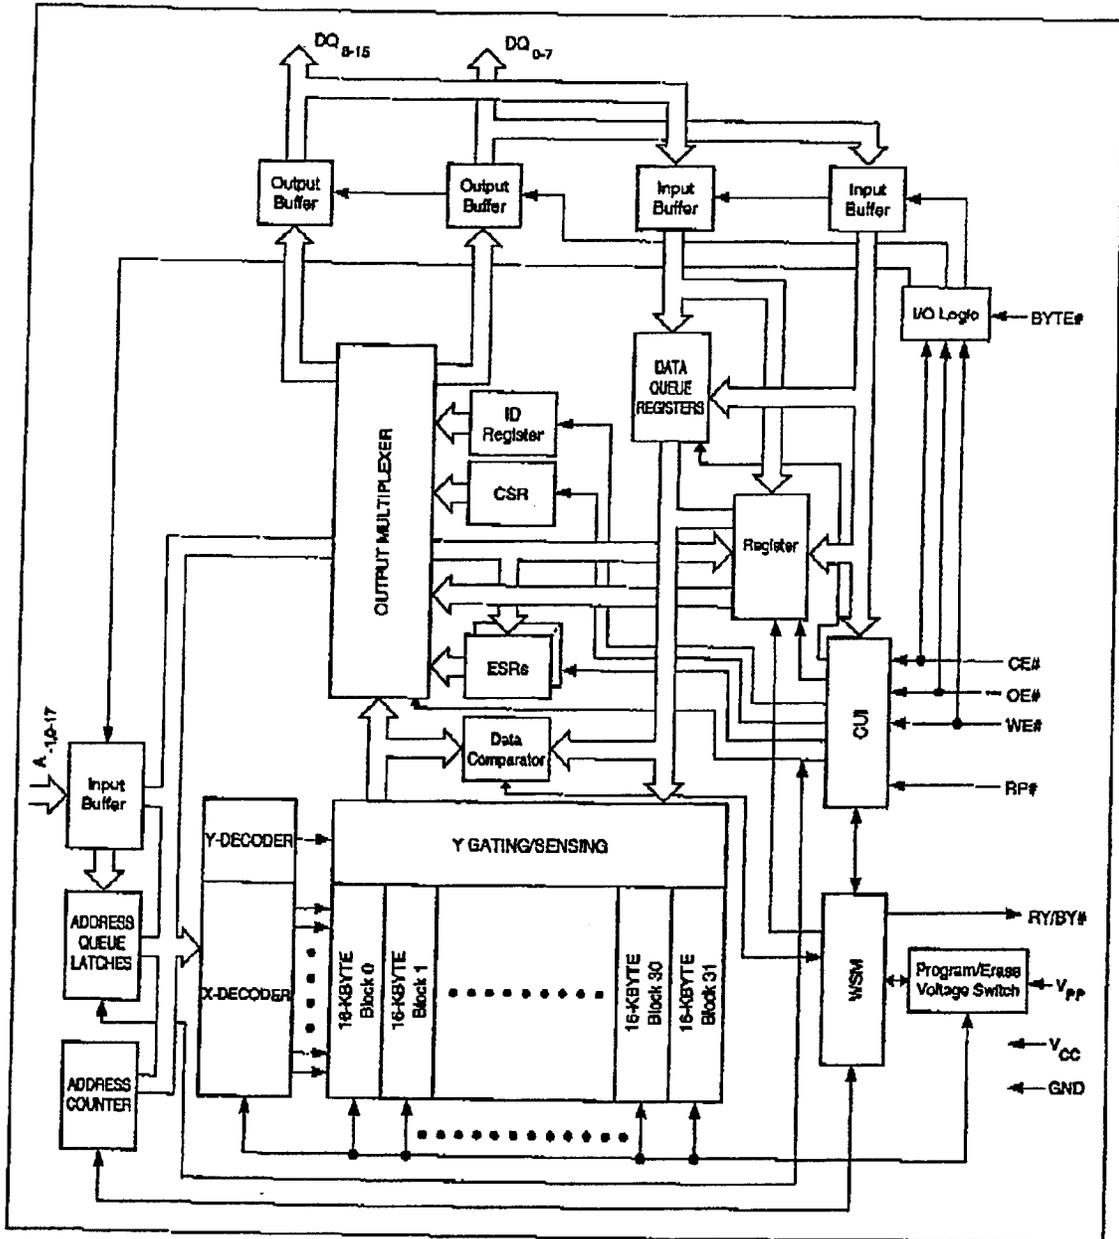

Figure 1. LH28F400SUT-LC12 Block Diagram

2.1 Lead Descriptions

Symbol	Type	Name and Function
DQ ₁₆ /A ₋₁	INPUT	BYTE-SELECT ADDRESS: Selects between high and low byte when device is in x8 mode. This address is latched in x8 Data Writes. Not used in x16 mode (i.e., the DQ ₁₅ /A ₋₁ Input buffer is turned off when BYTE# is high).
A ₀ -A ₁₂	INPUT	WORD-SELECT ADDRESSES: Select a word within one 16-Kbyte block. These addresses are latched during Data Writes.
A ₁₃ -A ₁₇	INPUT	BLOCK-SELECT ADDRESSES: Select 1 of 32 Erase blocks. These addresses are latched during Data Writes, Erase and Lock-Block operations.
DQ ₀ -DQ ₇	INPUT/OUTPUT	LOW-BYTE DATA BUS: Inputs data and commands during CUI write cycles. Outputs array, buffer, identifier or status data in the appropriate Read mode. Floated when the chip is de-selected or the outputs are disabled.
DQ ₈ -DQ ₁₅	INPUT/OUTPUT	HIGH-BYTE DATA BUS: Inputs data during x16 Data-Write operations. Outputs array, buffer or identifier data in the appropriate Read mode; not used for Status register reads. Floated when the chip is de-selected or the outputs are disabled. DQ ₁₅ /A ₋₁ is address.
CE#	INPUT	CHIP ENABLE INPUTS: Activate the device's control logic, input buffers, decoders and sense amplifiers. CE# must be low to select the device.
RP#	INPUT	RESET/POWER-DOWN: With RP# low, the device is reset, any current operation is aborted and device is put into the deep power down mode. When the power is turned on, RP# pin is turned to low in order to return the device to default configuration. When the power transition is occurred, or the power on/off, RP# is required to stay low in order to protect data from noise. When returning from Deep Power-Down, a recovery time of 620 ns is required to allow these circuits to power-up. When RP# goes low, any current or pending WSM operation(s) are terminated, and the device is reset. All Status registers return to ready (with all status flags cleared). After returning, the device is in read array mode.
OE#	INPUT	OUTPUT ENABLE: Gates device data through the output buffers when low. The outputs float to tri-state off when OE# is high.
WE#	INPUT	WRITE ENABLE: Controls access to the CUI, Data Queue Registers and Address Queue Latches. WE# is active low, and latches both address and data (command or array) on its rising edge.
RY/BY#	OPEN DRAIN OUTPUT	READY/BUSY: Indicates status of the internal WSM. When low, it indicates that the WSM is busy performing an operation. When the WSM is ready for new operation or Erase is Suspended, or the device is in deep power-down mode RY/BY# pin is floated.
BYTE#	INPUT	BYTE ENABLE: BYTE# low places device in x8 mode. All data is then input or output on DQ ₀₋₇ , and DQ ₈₋₁₅ float. Address A ₋₁ selects between the high and low byte. BYTE# high places the device in x16 mode, and turns off the A ₋₁ Input buffer. Address A ₀ , then becomes the lowest order address.
V _{PP}	SUPPLY	ERASE/WRITE POWER SUPPLY (5.0V ± 0.5V): For erasing memory array blocks or writing words/bytes into the flash array.
V _{CC}	SUPPLY	DEVICE POWER SUPPLY (3.3V ± 0.3V): Do not leave any power pins floating.
GND	SUPPLY	GROUND FOR ALL INTERNAL CIRCUITRY: Do not leave any ground pins floating.
NC		NO CONNECT: No internal connection to die, lead may be driven or left floating.

In Word-wide (x16) mode A_1 , don't care, address values are ignored A_1 .

4.0 BUS OPERATIONS, COMMANDS AND STATUS REGISTER DEFINITIONS

4.1 Bus Operations for Word-Wide Mode (Byte#=V_{IH})

Mode	Notes	RP#	CE#	OE#	WE#	A ₀	DQ ₀₋₁₅	RY/BY#
Read	1,2,7	V _{IH}	V _{IL}	V _{IL}	V _{IH}	X	D _{OUT}	X
Output Disable	1,6,7	V _{IH}	V _{IL}	V _{IH}	V _{IH}	X	High Z	X
Standby	1,6,7	V _{IH}	V _{IH}	X	X	X	High Z	X
Deep Power-Down	1,3	V _{IL}	X	X	X	X	High Z	V _{OH}
Manufacturer ID	4	V _{IH}	V _{IL}	V _{IL}	V _{IH}	V _{IL}	00B0H	V _{OH}
Device ID	4	V _{IH}	V _{IL}	V _{IL}	V _{IH}	V _{IH}	ID	V _{OH}
Write	1,5,6	V _{IH}	V _{IL}	V _{IH}	V _{IL}	X	D _{IN}	X

4.2 Bus Operations for Byte-Wide Mode (Byte#=V_L)

Mode	Notes	RP#	CE#	OE#	WE#	A ₀	DQ ₀₋₇	RY/BY#
Read	1,2,7	V _{IH}	V _{IL}	V _{IL}	V _{IH}	X	D _{OUT}	X
Output Disable	1,6,7	V _{IH}	V _{IL}	V _{IH}	V _{IH}	X	High Z	X
Standby	1,6,7	V _{IH}	V _{IH}	X	X	X	High Z	X
Deep Power-Down	1,3	V _{IL}	X	X	X	X	High Z	V _{OH}
Manufacturer ID	4	V _{IH}	V _{IL}	V _{IL}	V _{IH}	V _{IL}	B0H	V _{OH}
Device ID	4	V _{IH}	V _{IL}	V _{IL}	V _{IH}	V _{IH}	ID	V _{OH}
Write	1,5,6	V _{IH}	V _{IL}	V _{IH}	V _{IL}	X	D _{IN}	X

NOTES:

1. X can be V_{IH} or V_{IL} for address or control pins except for RY/BY#, which is either V_{OL} or V_{OH}.
2. RY/BY# output is open drain. When the WSM is ready, Erase is suspended or the device is in deep power-down mode, RY/BY# will be at V_{OH} if it is tied to V_{CC} through a resistor. When the RY/BY# at V_{OL} is independent of OE# while a WSM operation is in progress.
3. RP# at GND ± 0.2V ensures the lowest deep power-down current.
4. A₀ at V_L provide manufacturer ID codes.
5. A₀ at V_{IH} provide device ID codes. Device ID Code = 23H (x8). Device ID Code = 6623H (x16). All other addresses are set to zero.
6. Commands for different Erase operations, Data Write operations, and Lock-Block operations can only be successfully completed when V_{PP} = V_{PPU}.
7. While the WSM is running, RY/BY# in Level-Mode (default) stays at V_{OL} until all operations are complete. RY/BY# goes to V_{OH} when the WSM is not busy or in erase suspend mode.
8. RY/BY# may be at V_{OL} while the WSM is busy performing various operations. For example, a status register read during a write operation.

PRELIMINARY

LHF40S17

4.3 LH28F008SA-Compatible Mode Command Bus Definitions

Command	Notes	First Bus Cycle			Second Bus Cycle		
		Oper	Addr	Data	Oper	Addr	Data
Read Array		Write	X	FFH	Read	AA	AD
Intelligent Identifier	1	Write	X	90H	Read	IA	ID
Read Compatible Status Register	2	Write	X	70H	Read	X	CSR.D
Clear Status Register	3	Write	X	50H			
Word Write		Write	X	40H	Write	WA	WD
Alternate Word Write		Write	X	10H	Write	WA	WD
Block Erase/Confirm	4	Write	X	20H	Write	BA	D0H
Erase Suspend/Resume	4	Write	X	B0H	Write	X	D0H

ADDRESS

AA = Array Address
BA = Block Address
IA = Identifier Address
WA = Write Address
X = Don't Care

DATA

AD = Array Data
CSR.D = CSR Data
ID = Identifier Data
WD = Write Data

NOTES:

1. Following the Intelligent Identifier command, two Read operations access the manufacturer and device signature codes.
2. The CSR is automatically available after device enters Data Write, Erase, or Suspend operations.
3. Clears CSR.3, CSR.4 and CSR.5. See Status register definitions.
4. While device performs Block Erase, if you issue Erase Suspend command (B0H), be sure to confirm ESS (Erase-Suspend-Status) is set to 1 on compatible status register. In the case, ESS bit was not set to 1, also completed the Erase (ESS=0, WSMS=1), be sure to issue Resume command (D0H) after completed next Erase command. Beside, when the Erase Suspend command is issued, while the device is not in Erase, be sure to issue Resume command (D0H) after the next erase completed.

4.4 LH28F400SUT-LC12-Performance Enhancement Command Bus Definitions

Command	Mode	Notes	First Bus Cycle			Second Bus Cycle			Third Bus Cycle		
			Oper	Addr	Data	Oper	Addr	Data	Oper	Addr	Data
Protect Set/Confirm		1,2	Write	X	57H	Write	0FFH	D0H			
Protect Reset /Confirm		3	Write	X	47H	Write	0FFH	D0H			
Lock Block/Confirm		1,2,4	Write	X	77H	Write	BA	D0H			
Erase All Unlocked Blocks		1,2	Write	X	A7H	Write	X	D0H			
Two-Byte Write	x8	1,2,5	Write	X	FBH	Write	A -1	WD(L,H)	Write	WA	WD(H,L)

ADDRESS

BA = Block Address
WA = Write Address

DATA

AD = Array Data
WD (L,H) = Write Data (Low, High)
WD (H,L) = Write Data (High, Low)

X = Don't Care

NOTES:

1. After initial device power-up, or return from deep power-down mode, the block lock status bits default to the locked state independent of the data in the corresponding lock bits. In order to upload the lock bit status, it requires to write Protect Set/Confirm command.
2. To reflect the actual lock-bit status, the Protect Set/Confirm command must be written after Lock Block/Confirm command.
3. When Protect Reset/Confirm command is written, all blocks can be written and erased regardless of the state of the lock-bits.
4. The Lock Block/Confirm command must be written after Protect Reset/Confirm command was written.
5. A_1 is automatically complemented to load second byte of data. A_1 value determines which WD is supplied first: $A_1 = 0$ looks at the WDL, $A_1 = 1$ looks at the WDH. In word-wide (x16) mode A_1 don't care.
6. Second bus cycle address of Protect Set/Confirm and Protect Reset/Confirm command is 0FFH. Specifically $A_6-A_3 = 0$, $A_7-A_8 = 1$, others are don't care.

4.5 Compatible Status Register

WSMS	ESS	ES	DWS	VPPS	R	R	R
7	6	5	4	3	2	1	0

<p>CSR.7 = WRITE STATE MACHINE STATUS (WSMS) 1 = Ready 0 = Busy</p> <p>CSR.6 = ERASE-SUSPEND STATUS (ESS) 1 = Erase Suspended 0 = Erase in Progress/Completed</p> <p>CSR.5 = ERASE STATUS (ES) 1 = Error in Block Erasure 0 = Successful Block Erase</p> <p>CSR.4 = DATA-WRITE STATUS (DWS) 1 = Error in Data Write 0 = Data Write Successful</p> <p>CSR.3 = V_{pp} STATUS (VPPS) 1 = V_{pp} Low Detect, Operation Abort 0 = V_{pp} OK</p>	<p style="text-align: center;">NOTES:</p> <p>RY/BY# output or WSMS bit must be checked to determine completion of an operation (Erase Suspend, Erase or Data Write) before the appropriate Status bit (ESS, ES or DWS) is checked for success.</p> <p>If DWS and ES are set to "1" during an erase attempt, an improper command sequence was entered. Clear the CSR and attempt the operation again.</p> <p>The VPPS bit, unlike an A/D converter, does not provide continuous indication of V_{pp} level. The WSM interrogates V_{pp}'s level only after the Data-Write or Erase command sequences have been entered, and informs the system if V_{pp} has not been switched on. VPPS is not guaranteed to report accurate feedback between V_{PPL} and V_{PPH}.</p>
---	--

CSR.2-0 = RESERVED FOR FUTURE ENHANCEMENTS

These bits are reserved for future use and should be masked out when polling the CSR.

5.0 4M FLASH MEMORY SOFTWARE ALGORITHMS

5.1 Overview

With the advanced Command User Interface, its Performance Enhancement commands and Status Registers, the software code required to perform a given operation may become more intensive but it will result in much higher write/erase performance compared with current flash memory architectures.

The software flowcharts describing how a given operation proceeds are shown here. Figures 5-1 through 5-3 depict flowcharts using the 2nd generation flash device in the LH28F008SA-compatible mode. Figures 5-4 through 5-9 depict flowcharts using the 2nd generation flash device's performance enhancement commands mode.

When the device power-up or the device is reset by RP# pin, all blocks come up locked. Therefore, Word/Byte Write, Two Byte Serial Write and Block Erase can not be performed in each block. However, at that time, Erase All Unlocked Block is performed normally, if used, and reflect actual lock status, also the unlocked block data is erased. When the device power-up or the device is reset by RP# pin, Set Write Protect command must be written to reflect actual block lock status.

Reset Write Protect command must be written before Write Block Lock command. To reflect actual block lock status, Set Write Protect command is succeeded.

The Compatible Status Register (CSR) is used to determine which blocks are locked. In order to see Lock Status of a certain block, a Word/Byte Write command (WA=Block Address, WD=FFH) is written to the CUI, after issuing Set Write Protect command. If CSR7, CSR5 and CSR4 (WSMS, ES and DWS) are set to "1"s, the block is locked. If CSR7 is set to "1", the block is not locked.

Reset Write Protect command enables Write/Erase operation to each block.

In the case of Block Erase is performed, the block lock information is also erased. Block Lock command and Set Write Protect command must be written to prohibit Write/Erase operation to each block.

There are unassigned commands. It is not recommended that the customer use any command other than the valid commands specified in Chapter 4 "Command Bus Definitions". Sharp reserved the right to redefine these codes for future functions.

5.2 4M Flash Memory Algorithm Flowcharts

The following flowcharts describe the 2nd generation flash device modes of operation:

6.0 ELECTRICAL SPECIFICATIONS⁽¹⁾

Note: 1. V_{CC} supply range during read is 2.7 to 3.6V.

6.1 Absolute Maximum Ratings*

Temperature Under Bias 0°C to + 80°C
 Storage Temperature - 65°C to + 125°C

**WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.*

$V_{CC} = 3.3V \pm 0.3V$ Systems

Symbol	Parameter	Notes	Min	Max	Units	Test Conditions
T_A	Operating Temperature, Commercial	1	0	70	°C	Ambient Temperature
V_{CC}	V_{CC} with Respect to GND	2	-0.2	7.0	V	
V_{PP}	V_{PP} Supply Voltage with Respect to GND	2	-0.2	7.0	V	
V	Voltage on any Pin (except V_{CC} , V_{PP}) with Respect to GND	2	-0.5	$V_{CC} + 0.5$	V	
I	Current into any Non-Supply Pin			± 30	mA	
I_{OUT}	Output Short Circuit Current	3		100	mA	

NOTES:

1. Operating temperature is for commercial product defined by this specification.
2. Minimum DC voltage is - 0.5V on Input/output pins. During transitions, this level may undershoot to - 2.0V for periods < 20 ns. Maximum DC voltage on Input/output pins is $V_{CC} + 0.5V$ which, during transitions, may overshoot to $V_{CC} + 2.0V$ for periods < 20 ns.
3. Output shorted for no more than one second. No more than one output shorted at a time.

6.2 Capacitance

For a 3.3V System:

Symbol	Parameter	Note	Typ	Max	Units	Test Conditions
C_{IN}	Capacitance Looking into an Address/Control Pin	1	7	10	pF	$T_A = 25^\circ C, f = 1.0 \text{ MHz}$
	Capacitance Looking into an Address/Control Pin A-1	1	9	12	pF	$T_A = 25^\circ C, f = 1.0 \text{ MHz}$
C_{OUT}	Capacitance Looking Into an Output Pin	1	9	12	pF	$T_A = 25^\circ C, f = 1.0 \text{ MHz}$
C_{LOAD}	Load Capacitance Driven by Outputs for Timing Specifications	1		50	pF	For $V_{CC} = 3.3V \pm 0.3V$
	Equivalent Testing Load Circuit $V_{CC} \pm 10\%$			2.5	ns	50Ω transmission line delay

NOTE:

1. Sampled, not 100% tested.

6.3 Timing Nomenclature

For 3.3V systems use 1.5V cross point definitions.

Each timing parameter consists of 5 characters. Some common examples are defined below:

- t_{CE} t_{BLOW} time(t) from CE# (E) going low (L) to the outputs (Q) becoming valid (V)
- t_{OE} t_{GLOW} time(t) from OE# (G) going low (L) to the outputs (Q) becoming valid (V)
- t_{ACC} t_{AVQV} time(t) from address (A) valid (V) to the outputs (Q) becoming valid (V)
- t_{AS} t_{AVWH} time(t) from address (A) valid (V) to WE# (W) going high (H)
- t_{DH} t_{WHDZ} time(t) from WE# (W) going high (H) to when the data (D) can become undefined (X)

	Pin Characters		Pin States
A	Address Inputs	H	High
D	Data Inputs	L	Low
Q	Data Outputs	V	Valid
E	CE# (Chip Enable)	X	Driven, but not necessarily valid
G	OE# (Output Enable)	Z	High Impedance
W	WE# (Write Enable)		
P	RP# (Deep Power-Down Pin)		
R	RY/BY# (Ready/Busy#)		
V	Any Voltage Level		
3V	V _{CC} at 3.0V Minimum

28

DC Characteristics (Continued)

$V_{CC} = 3.3V \pm 0.3V$, $T_A = 0^\circ C$ to $+70^\circ C$

Symbol	Parameter	Notes	Min	Typ	Max	Units	Test Conditions
I_{PPR}	V_{PP} Read Current	1			200	μA	$V_{PP} > V_{CC}$
I_{PPW}	V_{PP} Write Current	1		15	35	mA	$V_{PP} = V_{PPH}$, Word/Byte Write in Progress
I_{PPE}	V_{PP} Erase Current	1		20	40	mA	$V_{PP} = V_{PPH}$, Block Erase in Progress
I_{PPEs}	V_{PP} Erase Suspend Current	1			200	μA	$V_{PP} = V_{PPH}$, Block Erase Suspended
V_{IL}	Input Low Voltage	5	- 0.3		0.8	V	
V_{IH}	Input High Voltage		2.0		$V_{CC} + 0.3$	V	
V_{OL}	Output Low Voltage				0.4	V	$V_{CC} = V_{CC}$ Min and $I_{OL} = 4$ mA
V_{OH1}	Output High Voltage		2.4			V	$I_{OH} = -2$ mA $V_{CC} = V_{CC}$ Min
V_{OH2}			$V_{CC} - 0.2$			V	$I_{OH} = -100$ μA $V_{CC} = V_{CC}$ Min
V_{PPL}	V_{PP} during Normal Operations	6	0.0		5.5	V	
V_{PPH}	V_{PP} during Write/ Erase Operations		4.5	5.0	5.5	V	
V_{LKO}	V_{CC} Erase/Write Lock Voltage		1.4			V	

NOTES:

1. All currents are in RMS unless otherwise noted. Typical values at $V_{CC} = 3.3V$, $V_{PP} = 5.0V$, $T = 25^\circ C$. These currents are valid for all product versions (package and speeds).
2. I_{CCES} is specified with the device de-selected. If the device is read while in erase suspend mode, current draw is the sum of I_{CCES} and I_{CCR} .
3. Automatic Power Saving (APS) reduces I_{CCR} to less than 1 mA in Static operation.
4. CMOS inputs are either $V_{CC} \pm 0.2V$ or $GND \pm 0.2V$. TTL inputs are either V_{IL} or V_{IH} .
5. In $2.7V < V_{CC} < 3.0V$ operation, TTL-level input of RP# is V_{IL} (Max.) = 0.6V.
6. V_{PPL} in read is $V_{CC} - 0.2V < V_{PPL} < 5.5V$ or $GND < V_{PPL} < GND + 0.2V$.

6.5 AC Characteristics - Read Only Operations⁽¹⁾

$V_{CC} = 3.3V \pm 0.3V$, $T_A = 0^\circ C$ to $+70^\circ C$

Symbol	Parameter	Notes	Min	Max	Units
t_{AVAV}	Read Cycle Time		120		ns
t_{AVGL}	Address Setup to OE# Going Low	3	0		ns
t_{AVQV}	Address to Output Delay			120	ns
t_{ELQV}	CE# to Output Delay	2		120	ns
t_{PHQV}	RP# High to Output Delay			620	ns
t_{GLQV}	OE# to Output Delay	2		45	ns
t_{ELQX}	CE# to Output in Low Z	3	0		ns
t_{EHQZ}	CE# to Output in High Z	3		50	ns
t_{GLOX}	OE# to Output in Low Z	3	0		ns
t_{GHQZ}	OE# to Output in High Z	3		30	ns
t_{OH}	Output Hold from Address, CE# or OE# Change, Whichever Occurs First	3	0		ns
t_{FLGZ}	BYTE# Low to Output in High Z	3		50	ns
t_{PLEL} t_{FHEL}	BYTE# High or Low to CE# Low	3	20		ns

NOTES:

1. See AC Input/Output Reference Waveforms for timing measurements, Figure 4.
2. OE# may be delayed up to $t_{ELQV} - t_{GLQV}$ after the falling edge of CE# without impact on t_{ELQV} .
3. Sampled, not 100% tested.

PRELIMINARY

LHF40S17

30

AC Characteristics - Read Only Operations⁽¹⁾ (Continued)

$V_{CC} = 2.85V \pm 0.15V$, $T_A = 0^\circ C$ to $+70^\circ C$

Symbol	Parameter	Notes	Min	Max	Units
tAVAV	Read Cycle Time		160		ns
tAVGL	Address Setup to OE# Going Low	3	0		ns
tAVOY	Address to Output Delay			160	ns
tELQV	CE# to Output Delay	2		160	ns
tPHQV	RP# High to Output Delay			800	ns
tELQV	OE# to Output Delay	2		55	ns
tELOX	CE# to Output in Low Z	3	0		ns
tEHOZ	CE# to Output in High Z	3		60	ns
tOLOX	OE# to Output in Low Z	3	0		ns
tGHOZ	OE# to Output in High Z	3		50	ns
tOH	Output Hold from Address, CE# or OE# Change, Whichever Occurs First	3	0		ns
tFLGZ	BYTE# Low to Output in High Z	3		75	ns
tFLEL tFHEL	BYTE# High or Low to CE# Low	3	25		ns

NOTES:

1. See AC Input/Output Reference Waveforms for timing measurements, Figure 4.
2. OE# may be delayed up to $t_{ELQV} - t_{ELOV}$ after the falling edge of CE# without impact on t_{ELQV} .
3. Sampled, not 100% tested.

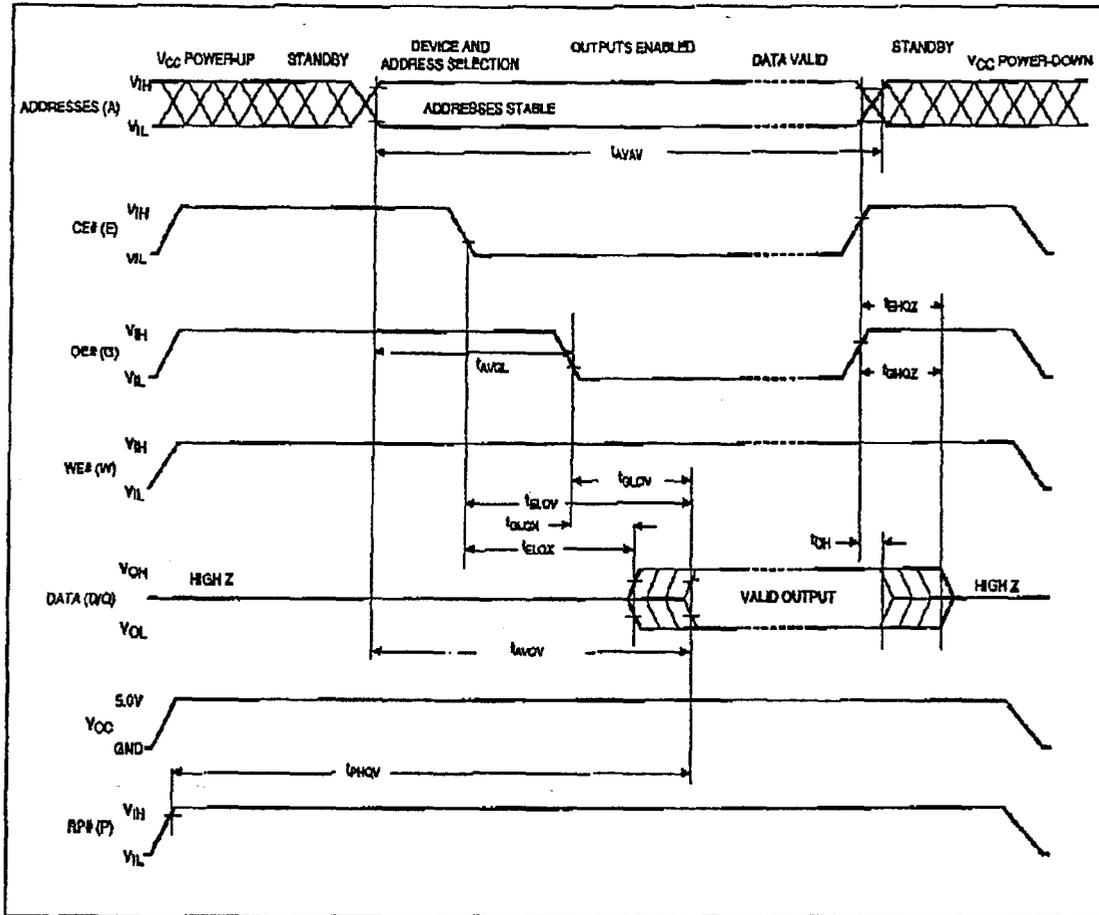

Figure 6. Read Timing Waveforms

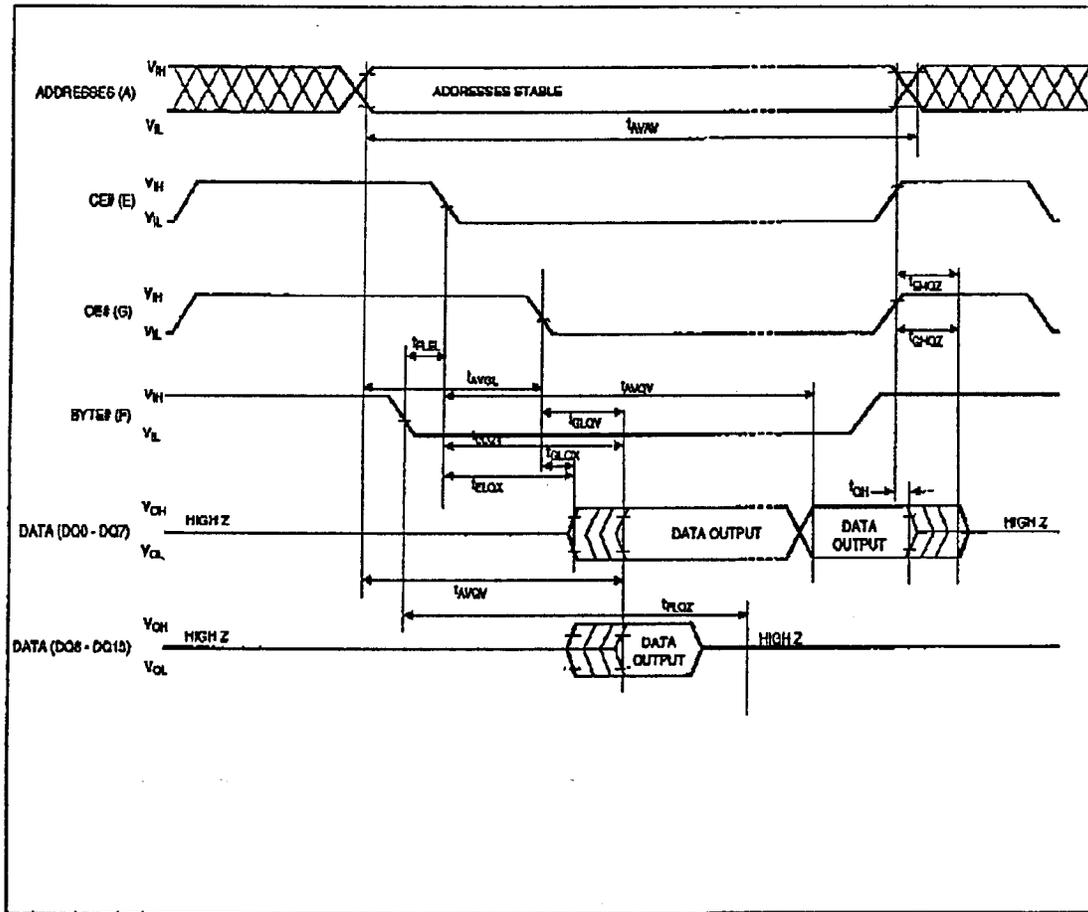

Figure 7. BYTE# Timing Waveforms

6.6 Power-Up and Reset Timings

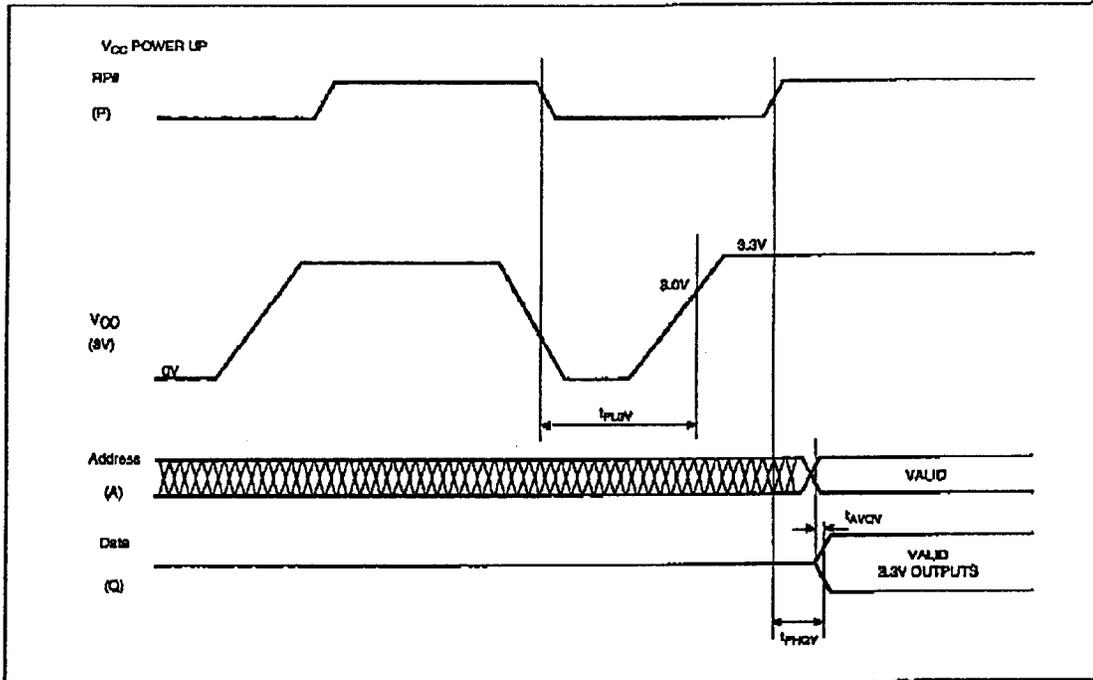

Figure 8. V_{CC} Power-Up and $RP\#$ Reset Waveforms

Symbol	Parameter	Note	Min	Max	Unit
t_{PL3V}	$RP\#$ Low to V_{CC} at 3.0V Minimum	1	0		μs
t_{AVQV}	Address Valid to Data Valid for $V_{CC} = 3.3V \pm 0.3V$	2		120	ns
t_{PHQV}	$RP\#$ High to Data Valid for $V_{CC} = 3.3V \pm 0.3V$	2		620	ns

NOTES:

$CE\#$ and $OE\#$ are switched low after Power-Up.

1. The power supply may start to switch concurrently with $RP\#$ going Low. $RP\#$ is required to stay low, until V_{CC} stays at recommended operating voltage.

2. The address access time and $RP\#$ high to data valid time are shown for 3.3V V_{CC} operation. Refer to the AC Characteristics Read Only Operations also.

6.7 AC Characteristics for WE# - Controlled Command Write Operations⁽¹⁾ $V_{CC} = 3.3 \pm 0.3V$, $T_A = 0^\circ C$ to $+70^\circ C$

Symbol	Parameter	Notes	Min	Typ	Max	Unit
tAVAV	Write Cycle Time		120			ns
tVPWH	V _{PP} Setup to WE# Going High	3	100			ns
tPHEL	RP# Setup to CE# Going Low		480			ns
tELWL	CE# Setup to WE# Going Low		10			ns
tAVWH	Address Setup to WE# Going High	2,6	110			ns
tDVWH	Data Setup to WE# Going High	2,6	110			ns
tWLWH	WE# Pulse Width		110			ns
tWHDX	Data Hold from WE# High	2	5			ns
tWHAX	Address Hold from WE# High	2	5			ns
tWHEH	CE# Hold from WE# High		5			ns
tWHWL	WE# Pulse Width High		60			ns
tGHWL	Read Recovery before Write		0			ns
tWHRL	WE# High to RY/BY# Going Low				100	ns
tRHPL	RP# Hold from Valid Status Register Data and RY/BY# High	3	0			ns
tPHWL	RP# High Recovery to WE# Going Low		1			µs
tWHGL	Write Recovery before Read		95			ns
tQVVL	V _{PP} Hold from Valid Status Register Data and RY/BY# High		0			µs
tWHQV1	Duration of Byte Write Operation	4,5	8	20		µs
tWHQV2	Duration of Block Erase Operation	4	0.3			s

NOTES:

1. Read timing during write and erase are the same as for normal read.
2. Refer to command definition tables for valid address and data values.
3. Sampled, but not 100% tested.
4. Write/Erase durations are measured to valid Status Register (CSR) Data.
5. Byte write operations are typically performed with 1 Programming Pulse.
6. Address and Data are latched on the rising edge of WE# for all Command Write operations.

PRELIMINARY

LHF40S17

6.8 AC Characteristics for CE# - Controlled Command Write Operations⁽¹⁾

$V_{CC} = 3.3V \pm 0.3V$, $T_A = 0^\circ C$ to $+70^\circ C$

Symbol	Parameter	Notes	Min	Typ	Max	Unit
t _{AVAV}	Write Cycle Time		120			ns
t _{PHWL}	RP# Setup to WE# Going Low	3	480			ns
t _{VPEH}	V _{PP} Setup to CE# Going High	3	100			ns
t _{WLEL}	WE# Setup to CE# Going Low		0			ns
t _{AVEH}	Address Setup to CE# Going High	2,6	110			ns
t _{DVEH}	Data Setup to CE# Going High	2,6	110			ns
t _{CEH}	CE# Pulse Width		110			ns
t _{EHDX}	Data Hold from CE# High	2	5			ns
t _{EHAX}	Address Hold from CE# High	2	5			ns
t _{EHWH}	WE# Hold from CE# High		5			ns
t _{EHEL}	CE# Pulse Width High		60			ns
t _{GHEL}	Read Recovery before Write		0			ns
t _{EHRL}	CE# High to RY/BY# Going Low				100	ns
t _{RHPL}	RP# Hold from Valid Status Register Data and RY/BY# High	3	0			ns
t _{PHEL}	RP# High Recovery to CE# Going Low		1			µs
t _{EHGL}	Write Recovery before Read		95			ns
t _{CVL}	V _{PP} Hold from Valid Status Register Data and RY/BY# High		0			µs
t _{EHQV1}	Duration of Byte Write Operation	4,5	8	20		µs
t _{EHQV2}	Duration of Block Erase Operation	4	0.3			s

NOTES:

1. Read timing during write and erase are the same as for normal read.
2. Refer to command definition tables for valid address and data values.
3. Sampled, but not 100% tested.
4. Write/Erase durations are measured to valid Status Register (OSR) Data.
5. Byte write operations are typically performed with 1 Programming Pulse.
6. Address and Data are latched on the rising edge of CE# for all Command Write Operations.

6.9 Erase and Word/Byte Write Performance

$V_{CC} = 3.3V \pm 0.3V$, $T_A = 0^\circ C$ to $+70^\circ C$

Symbol	Parameter	Notes	Min	Typ ⁽¹⁾	Max	Units	Test Conditions
t _{WHRH1}	Byte Write Time	2		20		μs	
t _{WHRH2}	Two-Byte Serial Write Time	2,3		30		μs	
t _{WHRH3}	Word Write Time	2,4		30		μs	
t _{WHRH4}	16KB Block Write Time	2		0.33	1.3	s	Byte Write Mode
t _{WHRH5}	16KB Block Write Time	2,3		0.28	1.0	s	Two-Byte Serial Write Mode
t _{WHRH6}	16KB Block Write Time	2,4		0.26	1.0	s	Word Write Mode
	Block Erase Time (16KB)	2		0.8	10	s	
	Full Chip Erase Time	2,5		12-19.2		s	

NOTES:

1. 25°C, $V_{PP} = 5.0V$.
2. Excludes System-Level Overhead.
3. Two-Byte Serial Write mode is valid at x8-bit configuration only.
4. Word Write mode is valid at x16-bit configuration only.
5. Depends on the number of protected blocks.
