MITSUBISHI MICROCOMPUTERS **M37735M4LXXXHP**

SINGLE-CHIP 16-BIT CMOS MICROCOMPUTER

DESCRIPTION

The M37735M4LXXXHP is a single-chip microcomputer using the 7700 Family core. This single-chip microcomputer has a CPU and a bus interface unit. The CPU is a 16-bit parallel processor that can be an 8-bit parallel processor, and the bus interface unit enhances the memory access efficiency to execute instructions fast. This microcomputer also includes a 32 kHz oscillation circuit, in addition to the ROM, RAM, multiple-function timers, serial I/O, A-D converter, and so on.

Its strong points are the low power dissipation, the low supply voltage and the small package.

FEATURES

- Number of basic instructions 103
- Memory size ROM 32 Kbytes
- RAM 2048 bytes
- Instruction execution time
 - The fastest instruction at 12 MHz frequency 333 ns
- Single power supply 2.7–5.5 V
- Low power dissipation (At 3 V supply voltage, 12 MHz frequency)
 - 9 mW (Typ.)

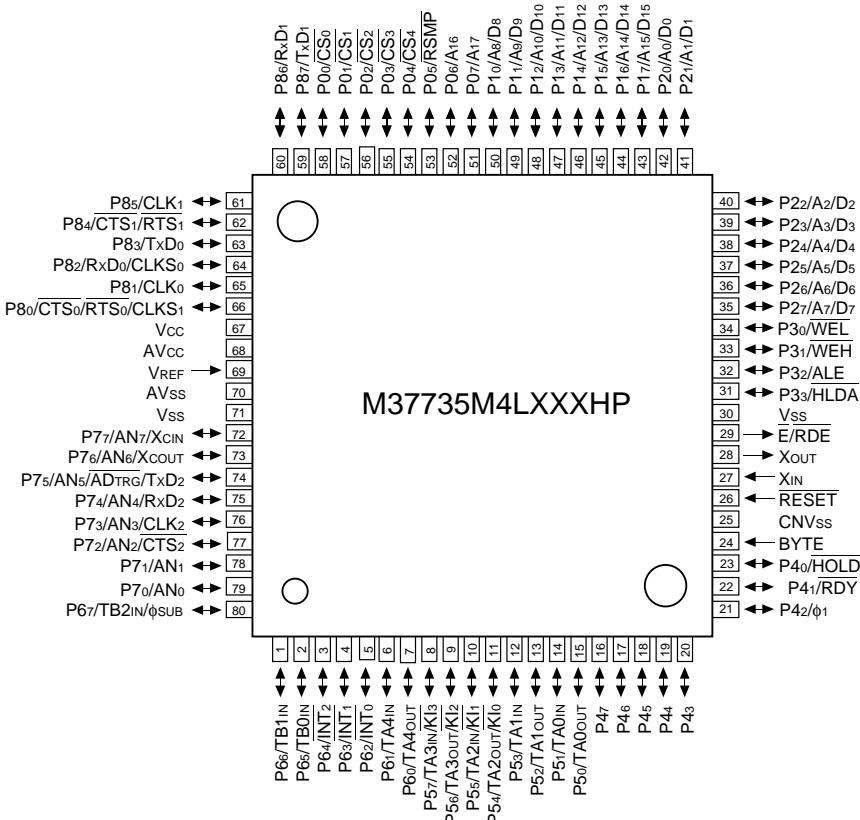

- Interrupts 19 types, 7 levels
- Multiple-function 16-bit timer 5 + 3
- Serial I/O (UART or clock synchronous) 3
- 10-bit A-D converter 8-channel inputs
- 12-bit watchdog timer
- Programmable input/output
 - (ports P0, P1, P2, P3, P4, P5, P6, P7, P8) 68
- Clock generating circuit 2 circuits built-in
- Small package 80-pin plastic molded fine-pitch QFP
(80P6D-A; 0.5 mm lead pitch)

APPLICATION

Control devices for general commercial equipment such as office automation, office equipment, personal information equipment, and so on.

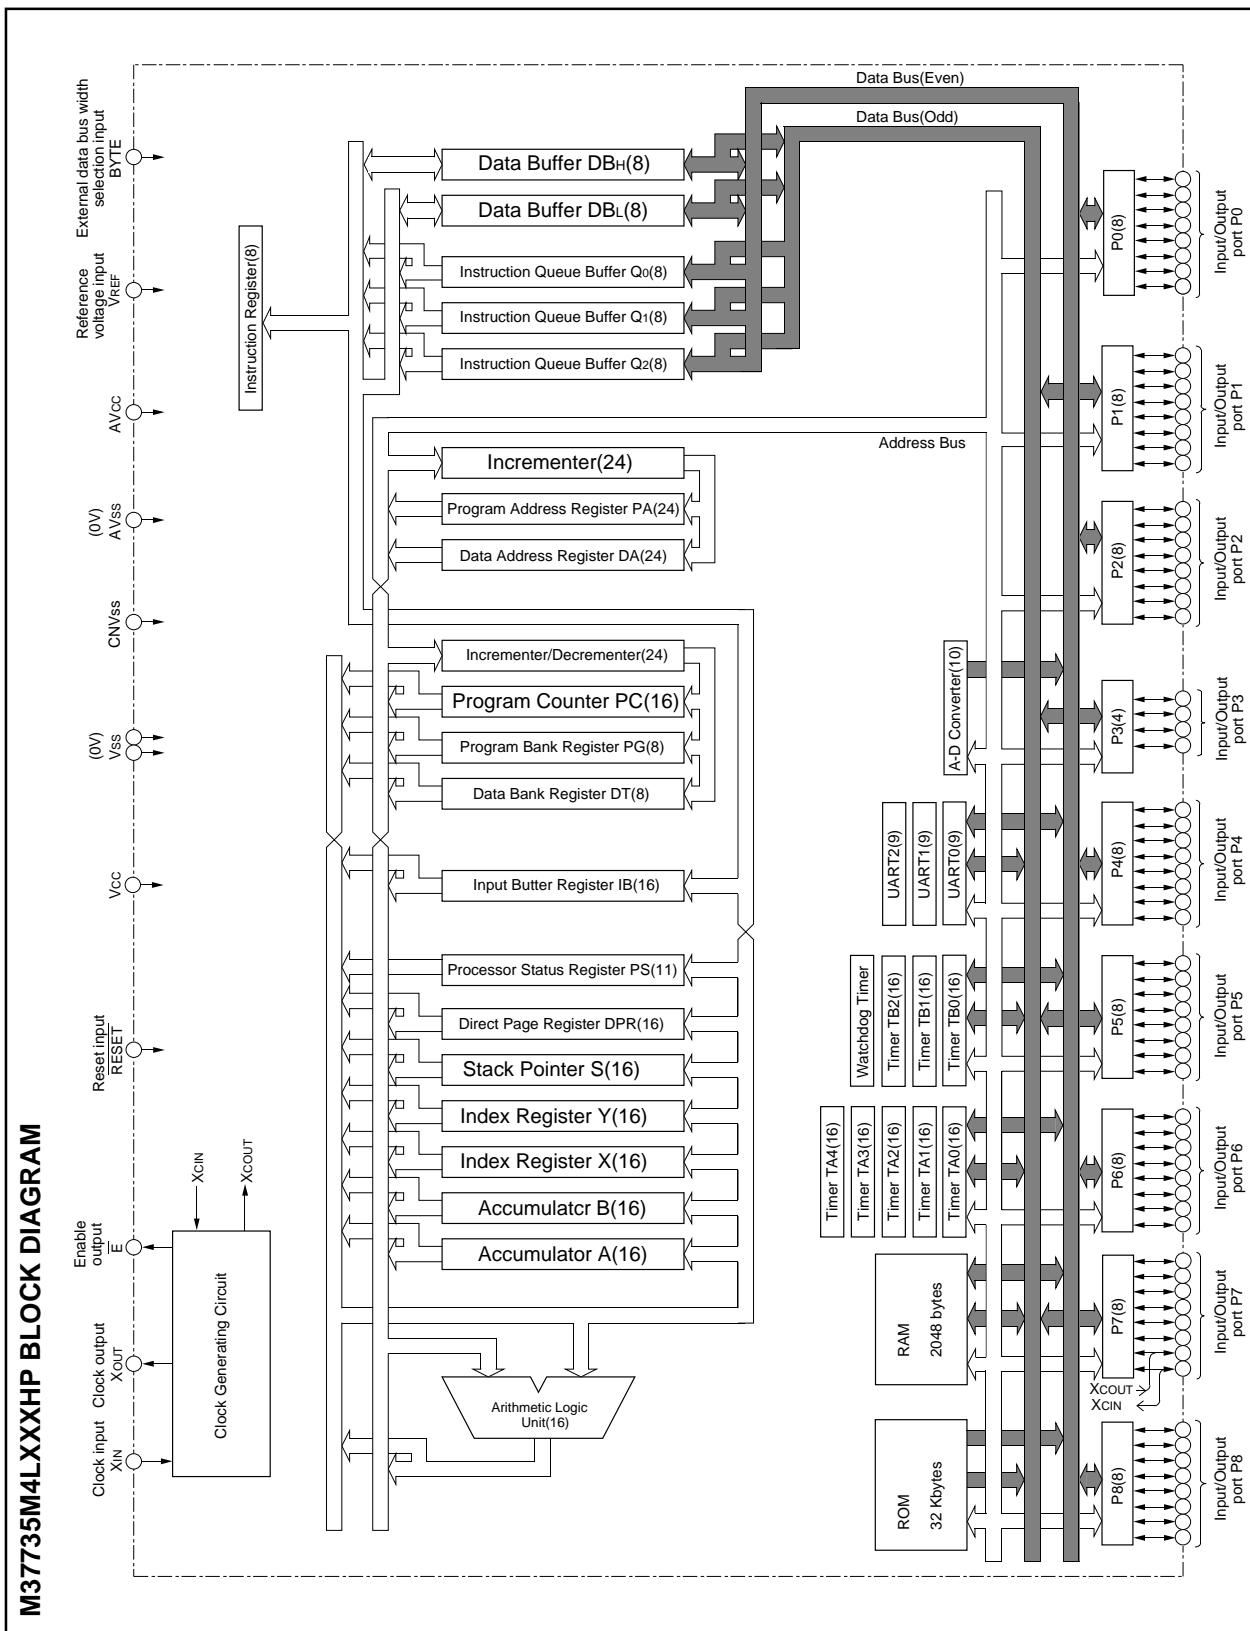

Control devices for general industrial equipment such as communication equipment, and so on.

FUNCTIONS OF M37735M4LXXHP

Parameter		Functions
Number of basic instructions		103
Instruction execution time		333 ns (the fastest instruction at external clock 12 MHz frequency)
Memory size	ROM	32 Kbytes
	RAM	2048 bytes
Input/Output ports	P0 – P2, P4 – P8	8-bit X 8
	P3	4-bit X 1
Multi-function timers	TA0, TA1, TA2, TA3, TA4	16-bit X 5
	TB0, TB1, TB2	16-bit X 3
Serial I/O		(UART or clock synchronous serial I/O) X 3
A-D converter		10-bit X 1 (8 channels)
Watchdog timer		12-bit X 1
Interrupts		3 external types, 16 internal types Each interrupt can be set to the priority level (0 – 7.)
Clock generating circuit		2 circuits built-in (externally connected to a ceramic resonator or a quartz-crystal oscillator)
Supply voltage		2.7 – 5.5 V
Power dissipation		9 mW (at 3 V supply voltage, external clock 12 MHz frequency) 22.5 mW (at 5 V supply voltage, external clock 12 MHz frequency)
Input/Output characteristic	Input/Output voltage	5 V
	Output current	5 mA
Memory expansion		Maximum 1 Mbytes
Operating temperature range		-40 to 85 °C
Device structure		CMOS high-performance silicon gate process
Package		80-pin plastic molded fine-pitch QFP (80P6D-A;0.5 mm lead pitch)

PIN DESCRIPTION

Pin	Name	Input/Output	Functions
Vcc, Vss	Power source		Apply 2.7 – 5.5 V to Vcc and 0 V to Vss.
CNVss	CNVss input	Input	This pin controls the processor mode. Connect to Vss for the single-chip mode and the memory expansion mode, and to Vcc for the microprocessor mode.
RESET	Reset input	Input	When "L" level is applied to this pin, the microcomputer enters the reset state.
XIN	Clock input	Input	These are pins of main-clock generating circuit. Connect a ceramic resonator or a quartz-crystal oscillator between XIN and XOUT. When an external clock is used, the clock source should be connected to the XIN pin, and the XOUT pin should be left open.
XOUT	Clock output	Output	
E	Enable output	Output	In the single-chip mode, this pin functions as the enable signal output pin which indicates the access status in the internal bus. In the memory expansion mode or the microprocessor mode, this pin functions as the RDE signal output pin.
BYTE	External data bus width selection input	Input	In the memory expansion mode or the microprocessor mode, this pin determines whether the external data bus has an 8-bit width or a 16-bit width. The data bus has a 16-bit width when "L" signal is input and an 8-bit width when "H" signal is input.
AVcc, AVss	Analog power source input		Power source input pin for the A-D converter. Externally connect AVcc to Vcc and AVss to Vss.
VREF	Reference voltage input	Input	This is reference voltage input pin for the A-D converter.
P00 – P07	I/O port P0	I/O	In the single-chip mode, port P0 becomes an 8-bit I/O port. An I/O direction register is available so that each pin can be programmed for input or output. These ports are in the input mode when reset. In the memory expansion mode or the microprocessor mode, these pins output CS0 – CS4, RSMP signals, and address (A16, A17).
P10 – P17	I/O port P1	I/O	In the single-chip mode, these pins have the same functions as port P0. When the BYTE pin is set to "L" in the memory expansion mode or the microprocessor mode and external data bus has a 16-bit width, high-order data (D8 – D15) is input/output or an address (A8 – A15) is output. When the BYTE pin is "H" and an external data bus has an 8-bit width, only address (A8 – A15) is output.
P20 – P27	I/O port P2	I/O	In the single-chip mode, these pins have the same functions as port P0. In the memory expansion mode or the microprocessor mode, low-order data (D0 – D7) is input/output or an address (A0 – A7) is output.
P30 – P33	I/O port P3	I/O	In the single-chip mode, these pins have the same function as port P0. In the memory expansion mode or the microprocessor mode, WEL, WEH, ALE, and HLDA signals are output.
P40 – P47	I/O port P4	I/O	In the single-chip mode, these pins have the same functions as port P0. In the memory expansion mode or the microprocessor mode, P40, P41, and P42 become HOLD and RDY input pins, and clock φ1 output pin, respectively. Functions of the other pins are the same as in the single-chip mode. However, in the memory expansion mode, P42 also functions as an I/O port.
P50 – P57	I/O port P5	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins also function as I/O pins for timers A0 to A3 and input pins for key input interrupt input (K10 – K13).
P60 – P67	I/O port P6	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins also function as I/O pins for timer A4, input pins for external interrupt input (INT0 – INT2) and input pins for timers B0 to B2. P67 also functions as sub-clock φSUB output pin.
P70 – P77	I/O port P7	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins function as input pins for A-D converter. P72 to P75 also function as I/O pins for UART2. Additionally, P76 and P77 have the function as the output pin (Xcout) and the input pin (Xcin) of the sub-clock (32 kHz) oscillation circuit, respectively. When P76 and P77 are used as the Xcout and Xcin pins, connect a resonator or an oscillator between the both.
P80 – P87	I/O port P8	I/O	In addition to having the same functions as port P0 in the single-chip mode, these pins also function as I/O pins for UART 0 and UART 1.

BASIC FUNCTION BLOCKS

The M37735M4LXXXHP has the same functions as the M37735MHBXXXFP except for the memory allocation, the reset circuit, the ROM area modification function, and the package. Refer to the section on the M37735MHBXXXFP.

MEMORY

The memory map is shown in Figure 1. The address space has a capacity of 16 Mbytes and is allocated to addresses from 016 to FFFFFFFF16. The address space is divided by 64-Kbyte unit called bank.

The banks are numbered from 016 to FF16.

However, banks 1016 – FF16 of the 7735 group cannot be accessed. Built-in ROM, RAM and control registers for internal peripheral devices are assigned to bank 016.

The 32-Kbyte area from addresses 800016 to FFFF16 is the built-in ROM. Addresses FFD616 to FFFF16 are the RESET and interrupt vector addresses and contain the interrupt vectors. Refer to the section on interrupts for details.

The 2048-byte area allocated to addresses from 8016 to 87F16 is the built-in RAM. In addition to storing data, the RAM is used as stack

during a subroutine call or interrupts.

Peripheral devices such as I/O ports, A-D converter, serial I/O, timer, and interrupt control registers are allocated to addresses from 016 to 7F16.

Additionally, the internal ROM area can be modified by software. Refer to the section on ROM area modification function for details.

A 256-byte direct page area can be allocated anywhere in bank 016 by using the direct page register (DPR). In the direct page addressing mode, the memory in the direct page area can be accessed with two words. Hence program steps can be reduced.

RESET CIRCUIT

The microcomputer is released from the reset state when the RESET pin is returned to "H" level after holding it at "L" level with the power source voltage at 2.7 – 5.5 V. Program execution starts at the address formed by setting address A₂₃ – A₁₆ to 0016, A₁₅ – A₈ to the contents of address FFFF₁₆, and A₇ – A₀ to the contents of address FFFE₁₆. Figure 3 shows an example of a reset circuit. When the stabilized clock is input from the external to the main-clock oscillation circuit, the reset input voltage must be 0.55 V or less when the power source voltage reaches 2.7 V. When a resonator/oscillator is connected to the main-clock oscillation circuit, change the reset input voltage from "L" to "H" after the main-clock oscillation is fully stabilized.

The status of the internal registers during reset is the same as the M37735MHBXXXFP's.

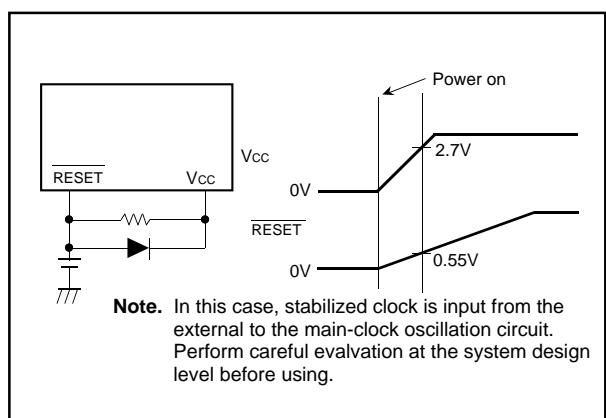

Fig. 3 Example of a reset circuit

ROM AREA MODIFICATION FUNCTION

The internal ROM size and its address area of the M37735M4LXXXHP can be modified by the memory allocation control register's bit 0 shown in Figure 4.

Figure 6 shows the memory allocation in which the internal ROM size and its address area are modified.

Make sure to write data in the memory allocation control register as the flow shown in Figure 5.

This ROM area modification function is valid in memory expansion mode and single-chip mode.

Table 1 shows the relationship between memory allocation selection

bits and address corresponding to chip-select signals $\overline{CS_0}$ and $\overline{CS_1}$. When ordering a mask ROM, Mitsubishi Electric corp. produces the mask ROM using the data within 32 Kbytes (addresses 008000₁₆ – 00FFFF₁₆). It is regardless of the selected ROM size (refer to MASK ROM ORDER CONFIRMATION FORM.) Therefore, program "FF₁₆" to the addresses out of the selected ROM area in the EPROM which you tender when ordering a mask ROM.

Address 00FFFF₁₆ of this microcomputer corresponds to the lowest address of the EPROM which you tender.

ADDRESSING MODES

The M37735M4LXXXHP has 28 powerful addressing modes. Refer to the MITSUBISHI SEMICONDUCTORS DATA BOOK SINGLE-CHIP 16-BIT MICROCOMPUTERS for the details of each addressing mode.

MACHINE INSTRUCTION LIST

The M37735M4LXXXHP has 103 machine instructions. Refer to the

ELECTRICAL CHARACTERISTICS (V_{CC} = 5 V, V_{SS} = 0 V, T_A = -40 to +85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit	
			Min.	Typ.	Max.		
I _{CC}	Power source current	When single-chip mode, output pins are open, and other pins are V _{SS} .	V _{CC} = 5 V, f(X _{IN}) = 12 MHz (square waveform), (f/f ₂) = 6 MHz, f(X _{CIN}) = 32.768 kHz, in operating (Note 1)		4.5	9	mA
			V _{CC} = 3 V, f(X _{IN}) = 12 MHz (square waveform), (f/f ₂) = 6 MHz, f(X _{CIN}) = 32.768 kHz, in operating (Note 1)		3	6	mA
			V _{CC} = 3 V, f(X _{IN}) = 12 MHz (square waveform), (f/f ₂) = 0.75 MHz, f(X _{CIN}) : Stopped, in operating		0.4	0.8	mA
			V _{CC} = 3 V, f(X _{IN}) = 12 MHz (square waveform), f(X _{CIN}) = 32.768 kHz, when a WIT instruction is executed (Note 2)		6	12	μA
			V _{CC} = 3 V, f(X _{IN}) : Stopped, f(X _{CIN}) = 32.768 kHz, in operating (Note 3)		30	60	μA
			V _{CC} = 3 V, f(X _{IN}) : Stopped, f(X _{CIN}) = 32.768 kHz, when a WIT instruction is executed (Note 4)		3	6	μA
			T _A = 25 °C, when clock is stopped			1	μA
			T _A = 85 °C, when clock is stopped			20	μA

Notes 1. This applies when the main clock external input selection bit = "1", the main clock division selection bit = "0", and the signal output stop bit = "1".

2. This applies when the main clock external input selection bit = "1" and the system clock stop bit at wait state = "1".

3. This applies when CPU and the clock timer are operating with the sub clock (32.768 kHz) selected as the system clock.

4. This applies when the X_{COUT} drivability selection bit = "0" and the system clock stop bit at wait state = "1".

*1. Confirmation

Specify the name of the product being ordered.

Three sets of EPROMs are required for each pattern (Check @ in the appropriate box).

If at least two of the three sets of EPROMs submitted contain the identical data, we will produce masks based on this data.

We shall assume the responsibility for errors only if the mask ROM data on the products we produce differ from this data.

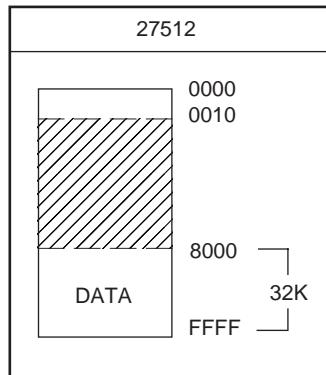

Thus, the customer must be especially careful in verifying the data contained in the EPROMs submitted.

Checksum code for entire EPROM areas

(hexadecimal notation)

EPROM Type :

- (1) Set "FF16" in the shaded area.
 - (2) Address 016 to 1016 are the area for storing the data on model designation and options. This area must be written with the data shown below.
- Details for option data are given next in the section describing the STP instruction option.
Address and data are written in hexadecimal notation.

Address	Address	Address
4D	0	4C
33	1	FF
37	2	FF
37	3	FF

*2. STP instruction option

One of the following sets of data should be written to the option data address (1016) of the EPROM you have ordered.

Check @ in the appropriate box.

*3. Mark specification

Mark specification must be submitted using the correct form for the type of package being ordered fill out the appropriate 80P6D Mark Specification Form (for M37735M4LXXXHP) and attach to the Mask ROM Order Confirmation Form.

80P6S (80-PIN QFP) MARK SPECIFICATION FORM

80P6D, 80P6Q (80-PIN Fine-pitch QFP)

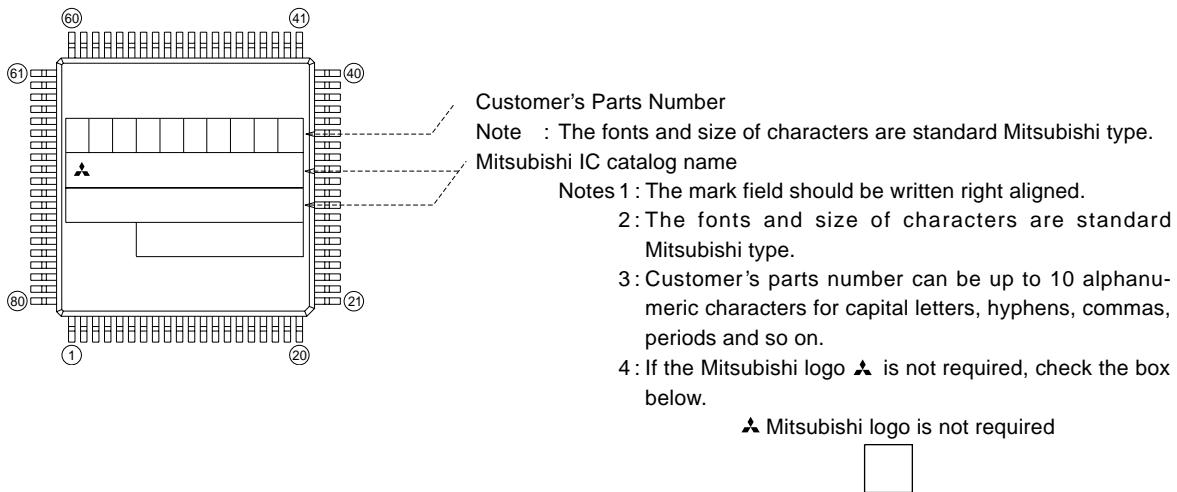

Mitsubishi IC catalog name

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

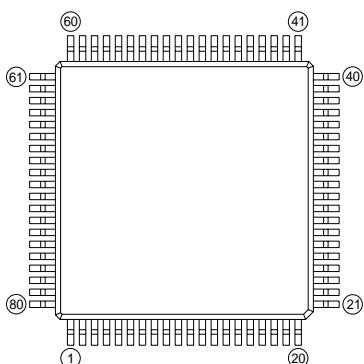

A. Standard Mitsubishi Mark

B. Customer's Parts Number + Mitsubishi IC Catalog Name

C. Special Mark Required

Notes 1: If Special mark is to be printed, indicate the desired layout of the mark in the left figure. The layout will be duplicated technically as close as possible. Mitsubishi product number (6-digit, or 7-digit) and Mask ROM number (3-digit) are always marked for sorting the products.

2: If special character fonts (e.g., customer's trade mark logo) must be used in Special Mark, check the box below.

For the new special character fonts, a clean font original (ideally logo drawing) must be submitted.

Special character fonts required

— Keep safety first in your circuit designs! —

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

— Notes regarding these materials —

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
