

DESCRIPTION

The M52755SP is a semiconductor integrated circuit for the RGBHV interface. The device features switching signals input from two types of image sources and outputting the signals to the CRT display, etc. Synchronous signals, meeting a frequency band of 10kHz to 200kHz, are output at TTL. The frequency band of video signals is 250MHz, acquiring high-resolution images, and are optimum as an interface IC with high-resolution CRT display and various new media.

FEATURES

- Frequency band: RGB.....250MHz

2 to 5V : Signal output from input 2

It is not allowable to set voltage higher than Vcc.

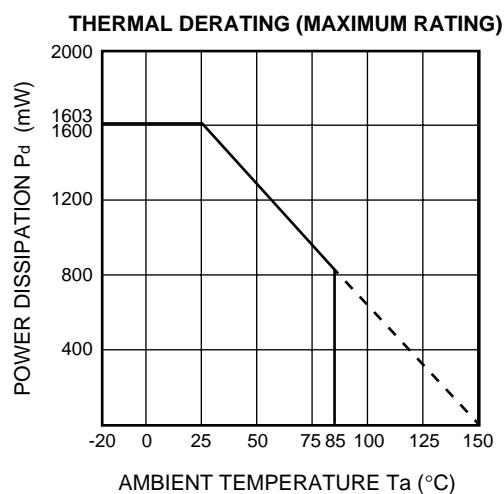

**Fig.3****NOTICE OF MAKING PRINTED CIRCUIT BOARD.**

Please notice following as shown below. It will maybe cause something oscillation because of the P.C.B. layout of the wide band analog switch.

- The distance between resistor and output pin is as short as possible when insert a output pull-down resistor.
- The capacitance of output terminal as small as possible.
- Set the capacitance between Vcc and GND near the pins if possible.
- Using stable power-source (if possible the separated power-source will be better).
- It will reduce the oscillation when add a resistor that is tens of ohms between output pin and next stage.
- Assign an area as large as possible for grounding.
