

**DESCRIPTION**

The M5678FP is a semiconductor integrated circuit in order 5ch actuator.

**FEATURES**

- Low saturation voltage.
- 3.3V DSP available.
- There are two motor power supplies.  
Vm1 CH1,2 motor power supply-1  
Vm2 CH3,4,5 motor power supply-2
- Built-in OP amp. for Regulator.  
(It enables a Regulator which consists of external PNP Tr.s and resistors.)
- Flexible Input amp. setting.(It enables PWM control.)
- Low cross-over distortion.(4.5V–13.2V)
- Wide supply voltage range.(4.5V–13.2V)
- Built-in Thermal Shut Down circuit.
- Built-in Mute circuit.(two systems)  
MUTE1:CH1~4, MUTE2:CH5

**APPLICATION**

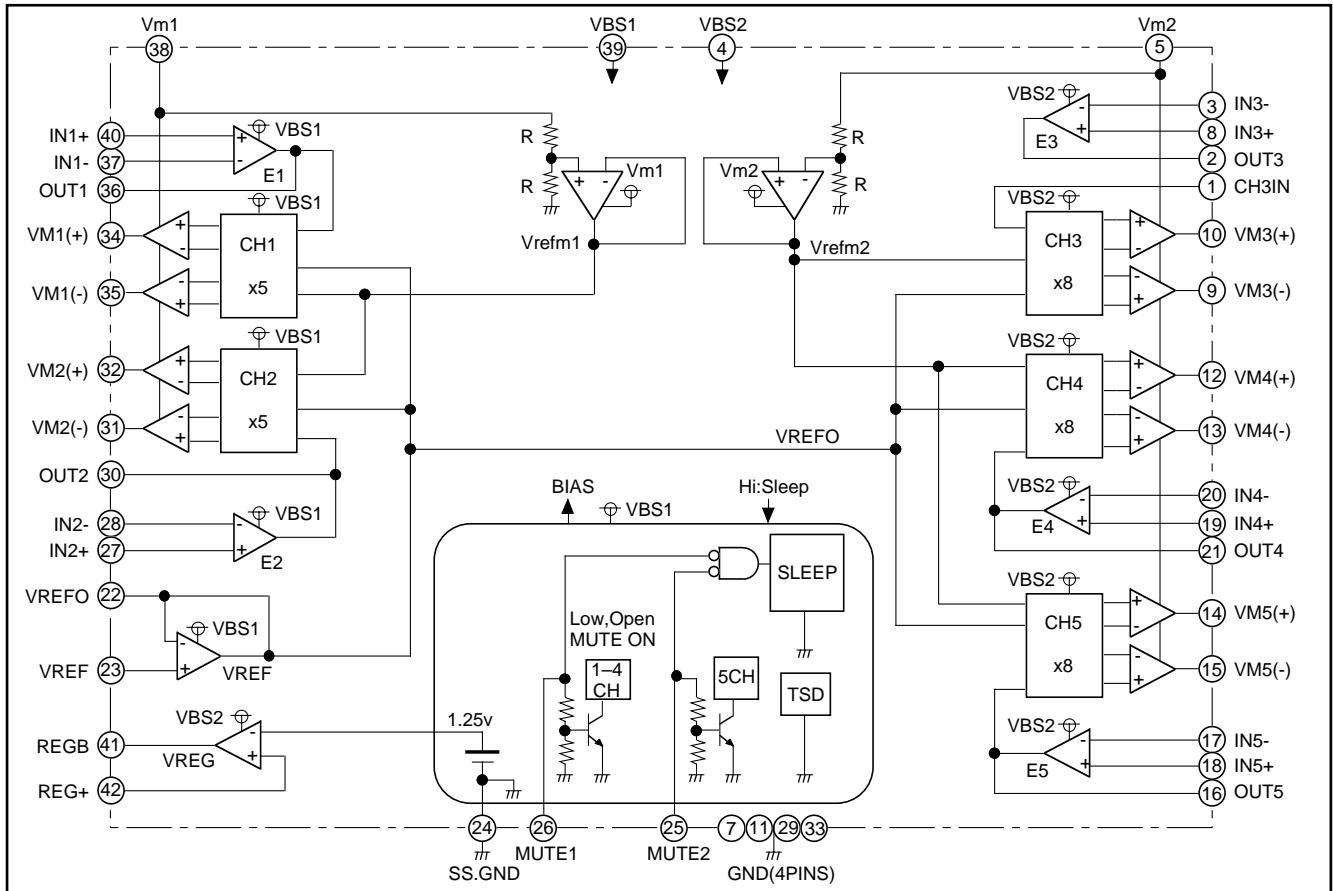

MD, CD-audio, CD-ROM, VCD,DVD etc.

**5 CHANNEL ACTUATOR DRIVER****MUTE Function**

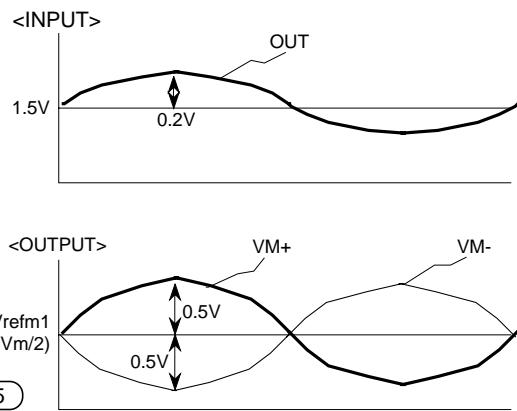

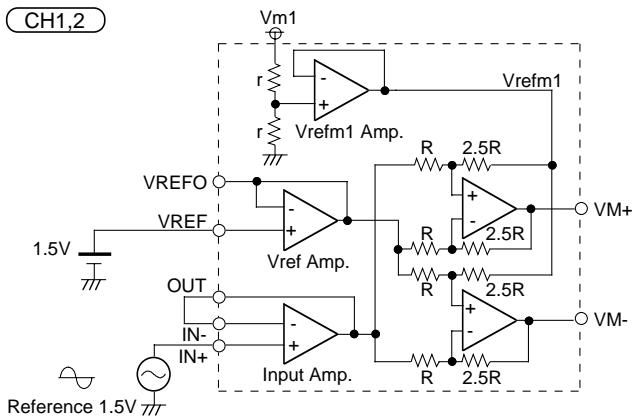

M5678FP has 2 MUTE terminals and the functions are as follows.

MUTE 1 ⑥ pin	MUTE 2 ⑤ pin	Power and Control Amp. circuits of CH1 to CH4.	Power and Control Amp. circuits of CH5.	VREF Amp.	VREG Amp.
High	High	ENABLE	ENABLE	ENABLE	ENABLE
Low/Open	High	DISABLE	ENABLE	ENABLE	ENABLE
High	Low/Open	ENABLE	DISABLE	ENABLE	ENABLE
Low/Open	Low/Open	DISABLE	DISABLE	DISABLE	ENABLE

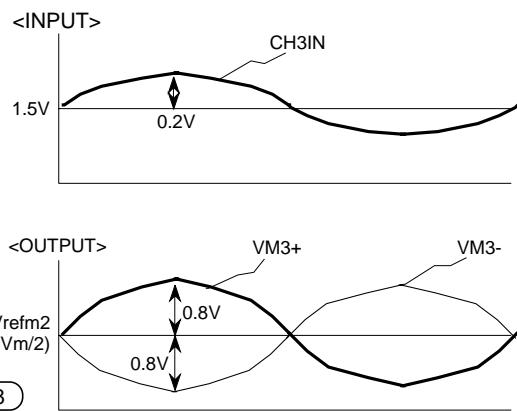

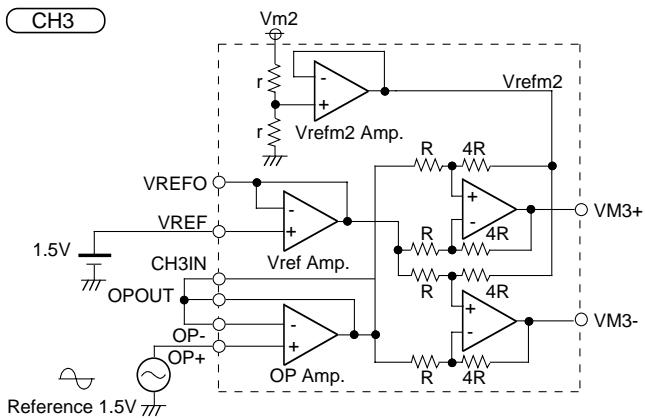

When both MUTE1 inputs and MUTE 2 inputs are low voltage or open, the IC is in Sleep Mode.

**I/O terminal equivalent circuit**

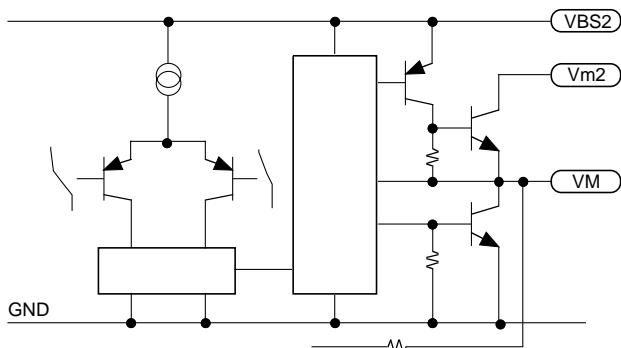

(7)CH1,CH2 power I/O terminal equivalent circuit

(VM1(+), VM1(-), VM2(+), VM2(-))

(8)CH3,CH4,CH5 power amplifier output terminal equivalent circuit

(VM3(+), VM3(-), VM4(+), VM4(-), VM5(+), VM5(-))

The equivalent circuits of an output stage of power amplifiers are shown in(7) and(8) .

The power supplies of CH1, CH2 are Vm1.

And the power supplies of CH3, CH4, CH5 are Vm2.

The source side of the power amplifier output stage consists of a PNP and a NPN.

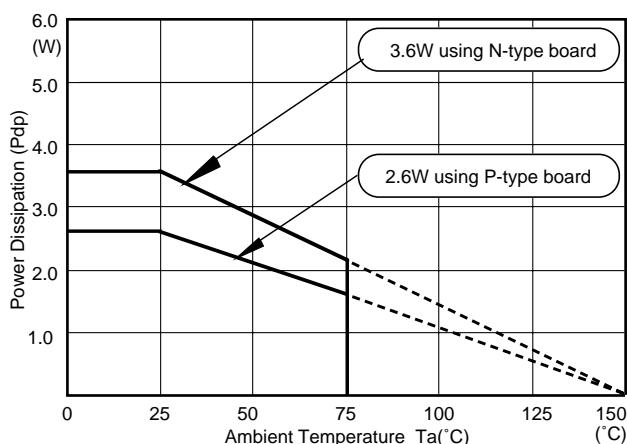

In the case of the CH1 and CH2, the emitta of the PNP is connected to VBS1, and in the case of the CH3, CH4 and CH5, it is connected to VBS2. So the power supplies of the PNP can be adjusted externally.

**[About bootstrap advantage]**

The output stage of the power amplifier consists of the preceding components. If  $VBS^*$  is provided with higher voltage input than  $Vm^*$ (The recommendation voltage is  $Vm^*+1V$ ) externally, the output range can be wider than that of  $VBS^*=Vm^*$ .

Please take advantage of this bootstrap function for the system which has many power supplies. And it is the same with the external bootstrap circuit which provides  $VBS^*$  with higher voltage inputs than  $Vm^*$ .

Also the bootstrap can decrease the saturation voltage at the source side of the power amplifier output stage. Therefore, when the outputs of the power amplifiers which drive motors and actuators are fully swung, the power dissipation of the IC will be decreased.

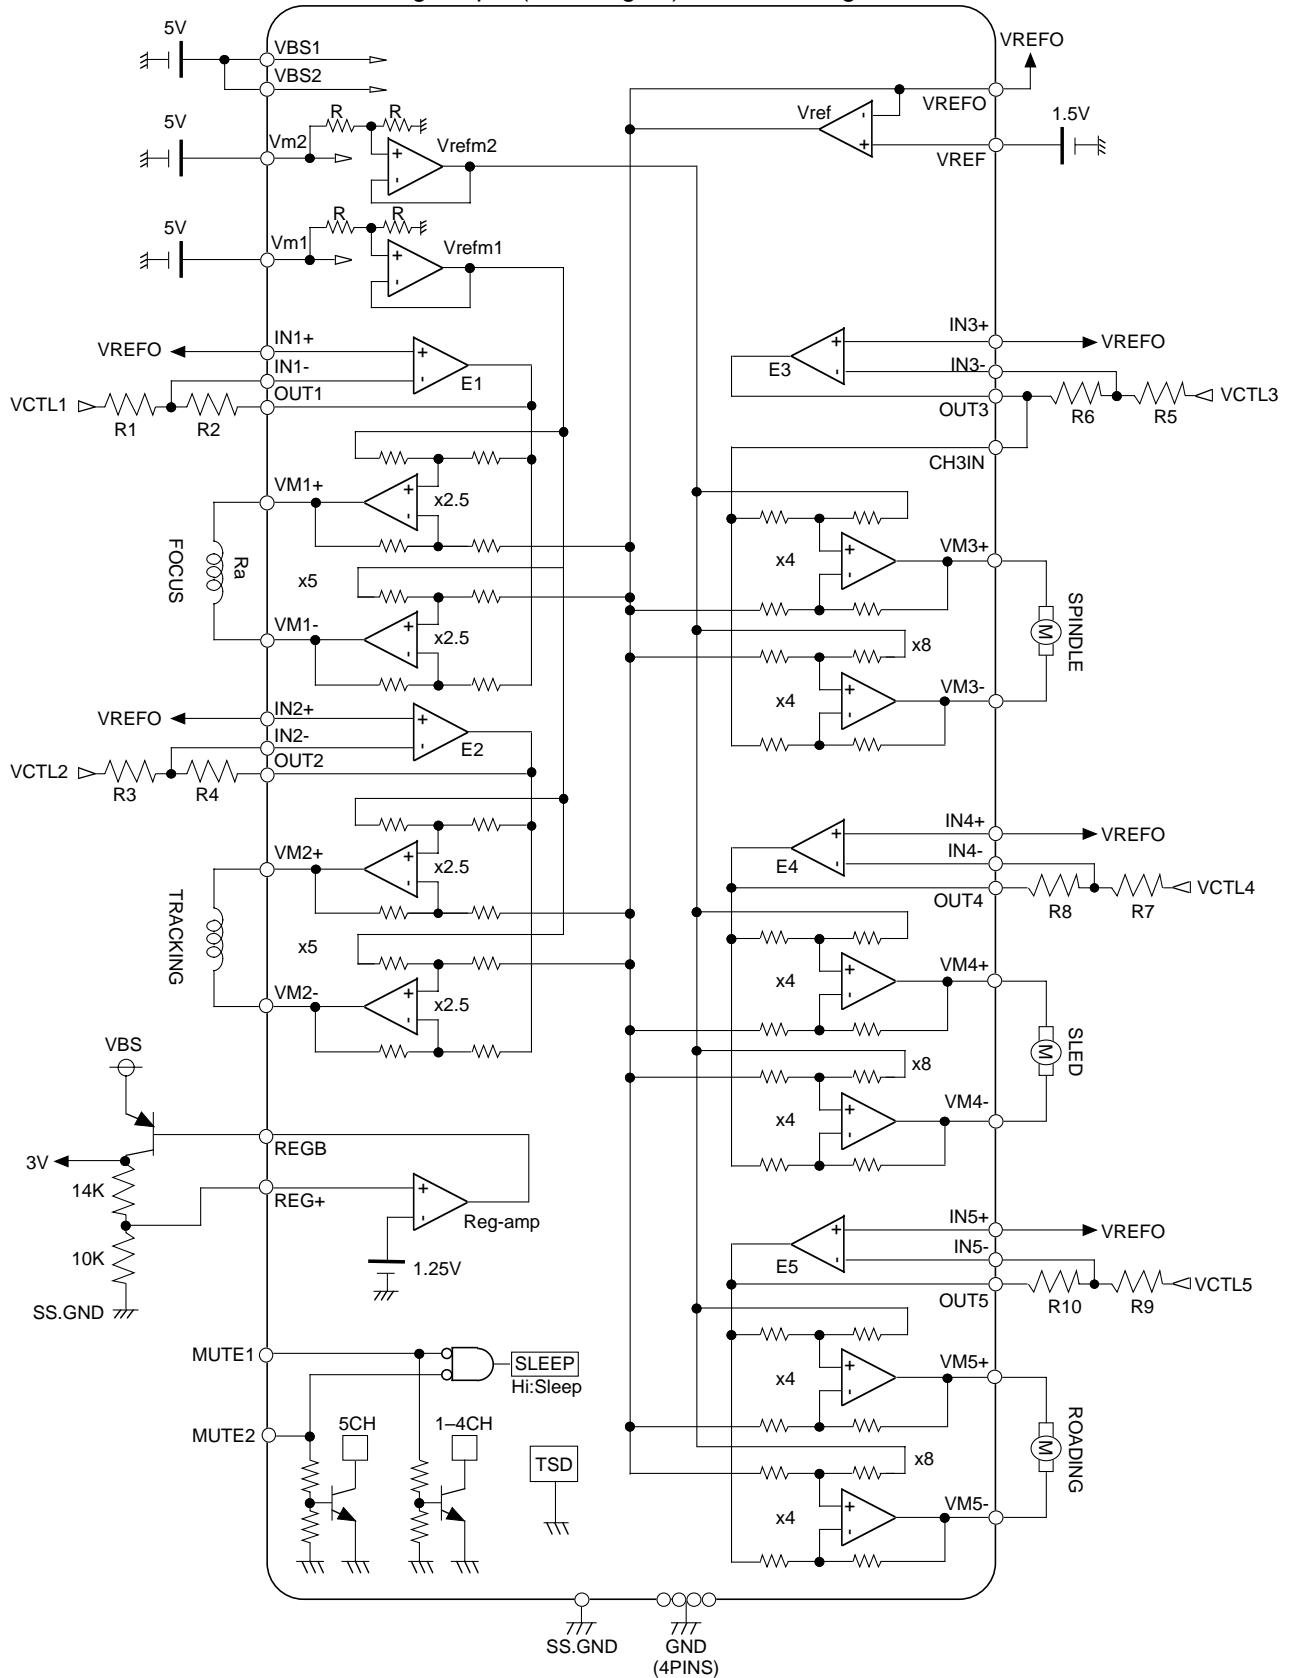

**THERMAL DERATING**

This IC's package is POWER-SSOP, so improving the board on which the IC is mounted enables a large power dissipation without a heat sink.

For example, using an 1 layer glass epoxy resin board, the IC's power dissipation is 2.6W at least. And it comes to 3.6W by using an improved 2 layer board.

The information of the N, P type board is shown in the board information.
