MC54/74F175

QUAD D FLIP-FLOP

The MC54/74F175 is a high-speed quad D flip-flop. The device is useful for general flip-flop requirements where both true and complementary outputs are required and clock and clear inputs are common to all flip-flops. The information on the D inputs is stored during the LOW-to-HIGH clock transition. Both true and complemented outputs of each flip-flop are provided. A Master Reset input resets all flip-flops, independent of the Clock or D inputs when LOW.

- Four Edge-triggered D-type Inputs
- Buffered Positive Edge-triggered Common Clock
- Buffered Asynchronous Common Reset
- True and Complementary Outputs
- ESD > 4000 Volts

FUNCTIONAL DESCRIPTION

The F175 consists of four edge-triggered D flop-flops with individual D inputs and Q and $\overline{Q}$ outputs. The Clock and Master Reset are common. The four flip-flops will store the state of their individual D inputs, one setup time before, on the LOW-to-HIGH clock (CP) transition, causing individual Q and $\overline{Q}$ outputs to follow. A LOW input on the Master Reset (MR) will force all Q outputs LOW and $\overline{Q}$ outputs HIGH independent of Clock or Data inputs. The F175 is useful for general logic applications where a common Master Reset and Clock are acceptable.
