

## 256K x 4 Bit Fast Static Random Access Memory

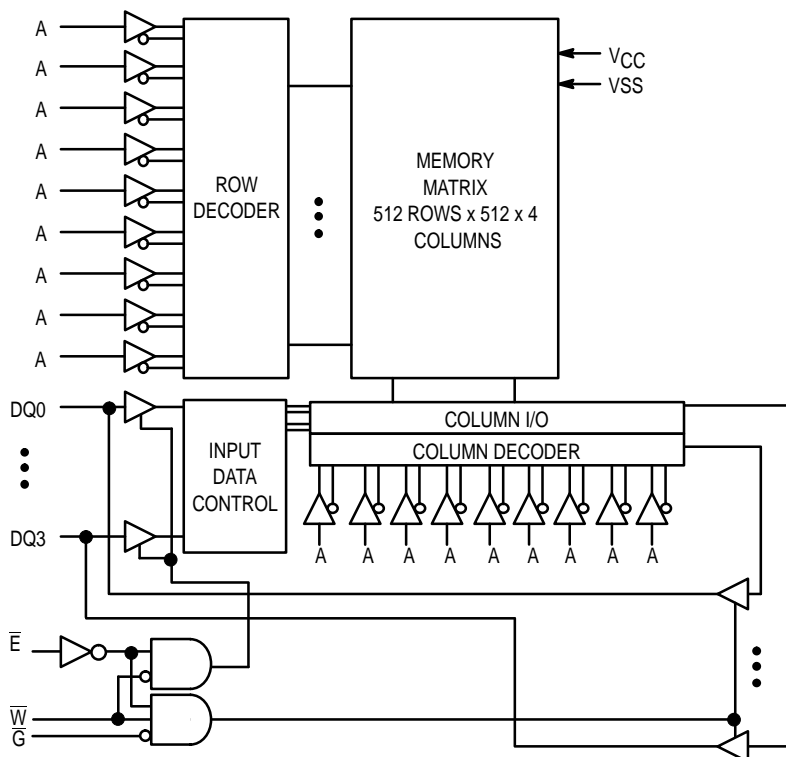

The MCM6729B is a 1,048,576 bit static random access memory organized as 262,144 words of 4 bits. This device is fabricated using high performance silicon-gate BiCMOS technology. Static design eliminates the need for external clocks or timing strobes.

Output enable ( $\bar{G}$ ) is a special control feature that provides increased system flexibility and eliminates bus contention problems.

This device meets JEDEC standards for functionality and revolutionary pinout, and is available in a 400 mil plastic small-outline J-leaded package.

- Single 5 V  $\pm$  10% Power Supply
- Fully Static — No Clock or Timing Strokes Necessary
- All Inputs and Outputs Are TTL Compatible
- Three State Outputs
- Fast Access Times: 8, 10, 12 ns
- Center Power and I/O Pins for Reduced Noise

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to these high-impedance circuits. This BiCMOS memory circuit has been designed to meet the dc and ac specifications shown in the tables, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow of at least 500 linear feet per minute is maintained.

Output Enable High to Output High-Z	t <sub>GHQZ</sub>	0	4	0	5	0	6	ns	4,5,6

### NOTES:

1.  $\overline{W}$  is high for read cycle.
2. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycles.
3. All read cycle timings are referenced from the last valid address to the first transitioning address.
4. At any given voltage and temperature, t<sub>EHQZ</sub> (max) < t<sub>ELQX</sub> (min), and t<sub>GHQZ</sub> (max) < t<sub>GLQX</sub> (min), both for a given device and from device to device.
5. Transition is measured 200 mV from steady-state voltage with load of Figure 1B.
6. This parameter is sampled and not 100% tested.
7. Device is continuously selected ( $\overline{E} = V_{IL}$ ,  $\overline{G} = V_{IL}$ ).
8. Addresses valid prior to or coincident with  $\overline{E}$  going low.

## TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address setup time is shown as a minimum since the system must supply at least that much time (even though most devices do not require it). On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.

## NOTES:

1. A write occurs during the overlap of  $\overline{E}$  low and  $\overline{W}$  low.
2. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycles.
3. All write cycle timings are referenced from the last valid address to the first transitioning address.
4. Transition is measured 200 mV from steady-state voltage with load of Figure 1B.
5. This parameter is sampled and not 100% tested.
6. At any given voltage and temperature,  $t_{WLQZ} \text{ max} < t_{WHQX} \text{ min}$  both for a given device and from device to device.
