

QUAD 2-PORT REGISTER

The SN54/74LS398 and SN54/74LS399 are Quad 2-Port Registers. They are the logical equivalent of a quad 2-input multiplexer followed by a quad 4-bit edge-triggered register. A Common Select input selects between two 4-bit input ports (data sources). The selected data is transferred to the output register on the LOW-to-HIGH transition of the Clock input. The SN54/74LS398 features both Q and Q inputs, while the SN54/74LS399 has only Q outputs.

- Select From Two Data Sources
- Fully Positive Edge-Triggered Operation
- Both True and Complemented Outputs on SN54/74LS398
- Input Clamp Diodes Limit High-Speed Termination Effects

FUNCTIONAL BLOCK DIAGRAM

* SN54/74LS398 only

FUNCTIONAL DESCRIPTION

The SN54/74LS398 and SN54/74LS399 are high-speed Quad 2-Port Registers. They select four bits of data from two sources (Ports) under the control of a common Select Input (S). The selected data is transferred to a 4-Bit Output Register synchronous with the LOW-to-HIGH transition of the Clock in-

put (CP). The 4-Bit RS type output register is fully edge-triggered. The Data inputs (I) and Select inputs (S) must be stable only a setup time prior to and hold time after the LOW-to-HIGH transition of the Clock input for predictable operation. The SN54/74LS398 has both Q and Q Outputs available.

FUNCTION TABLE

	INPUTS	OUTPUTS		
S	I ₀	l ₁	Q	Q*
I	- 1	Х	L	Н
I	h	Х	Н	L
h	Х	I	L	Н
h	Х	h	Н	L

^{*}SN54/74LS398 only

I = LOW Voltage Level one setup time pior to the LOW-to-HIGH clock transition

 $\label{eq:hamilton} h = HIGH \ \mbox{Voltage Level one setup time prior to the LOW-to-HIGH clock transition}$

L = LOW Voltage Level

H = HIGH Voltage Level

X = Immaterial

t _h	Hold Time, Any Input	0			ns		

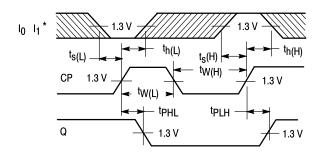

DEFINITIONS OF TERMS

SETUP TIME(t_S) — is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from LOW-to-HIGH in order to be recognized and transferred to the outputs.

HOLD TIME(th) — is defined as the minimum time following

the clock transition from LOW-to-HIGH that the logic level must be maintained at the input in order to ensure continued recognition. A negative Hold Time indicates that the correct logic level may be released prior to the clock transition from LOW-to-HIGH and still be recognized.

AC WAVEFORMS
