- Power Off Disables Inputs/Outputs, **Permitting Live Insertion**
- Distributed  $V_{\mbox{\scriptsize CC}}$  and GND Pin Configuration • **Minimizes High-Speed Switching Noise**
- Flow-Through Architecture Optimizes PCB Layout
- Package Options Include Plastic 300-mil Shrink Small-Outline (DL), Thin Shrink Small-Outline (DGG), and Thin Very Small-Outline (DGV) Packages and 380-mil Fine-Pitch Ceramic Flat (WD) Package Using 25-mil Center-to-Center Spacings

#### description

These 16-bit buffers/drivers are designed specifically for low-voltage (3.3-V) V<sub>CC</sub> operation, but with the capability to provide a TTL interface to a 5-V system environment.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Widebus is a trademark of Texas Instruments Incorporated.

UNLESS OTHERWISE NOTED this document contains PRODUCTION DATA information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters

#### description (continued)

These devices are noninverting 16-bit buffers composed of two 8-bit sections with separate output-enable signals. For either 8-bit buffer section, the two output-enable (10E1 and 10E2 or 20E1 and 20E2) inputs must be low for the corresponding Y outputs to be active. If either output-enable input is high, the outputs of that 8-bit buffer section are in the high-impedance state.

The A-port outputs, which are designed to source or sink up to 12 mA, include equivalent 22-Ω series resistors to reduce overshoot and undershoot.

When V<sub>CC</sub> is between 0 and 1.5 V, the device is in the high-impedance state during power up or power down. However, to ensure the high-impedance state above 1.5 V, OE should be tied to V<sub>CC</sub> through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

The SN54LVTH162541 is characterized for operation over the full military temperature range of -55°C to 125°C. The SN74LVTH162541 is characterized for operation from -40°C to 85°C.

#### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)<sup>†</sup>

| Supply voltage range, $V_{CC}$<br>Input voltage range, $V_I$ (see Note 1)<br>Voltage range applied to any output in the high<br>Current into any output in the low state, $I_O$<br>Current into any output in the high state, $I_O$ (see<br>Input clamp current, $I_{IK}$ ( $V_I < 0$ )<br>Output clamp current, $I_{OK}$ ( $V_O < 0$ )<br>Package thermal impedance, $\theta_{JA}$ (see Note 3): | or power-off state, V <sub>O</sub> (see Note 1) |  |
|---|---|--|
| Storage temperature range, T <sub>stg</sub>   |   |  |
|   |   |  |

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

- 2. This current flows only when the output is in the high state and  $V_O > V_{CC}$ .
- 3. The package thermal impedance is calculated in accordance with JESD 51.

#### recommended operating conditions (see Note 4)

<sup>†</sup> All typical values are at  $V_{CC}$  = 3.3 V,  $T_A$  = 25°C.

<sup>‡</sup> Skew between any two outputs of the same package switching in the same direction. This parameter is warranted but not production tested.

SCBS690 - MAY 1997

#### PARAMETER MEASUREMENT INFORMATION

NOTES: A. C<sub>1</sub> includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR  $\le$  10 MHz, Z<sub>O</sub> = 50  $\Omega$ , t<sub>f</sub>  $\le$  2.5 ns. t<sub>f</sub>  $\le$  2.5 ns. D. The outputs are measured one at a time with one transition per measurement.

#### **IMPORTANT NOTICE**

Texas Instruments (TI) reserves the right to make changes to its products or to discontinue any semiconductor product or service without notice, and advises its customers to obtain the latest version of relevant information to verify, before placing orders, that the information being relied on is current.

TI warrants performance of its semiconductor products and related software to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Certain applications using semiconductor products may involve potential risks of death, personal injury, or severe property or environmental damage ("Critical Applications").

TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS.

Inclusion of TI products in such applications is understood to be fully at the risk of the customer. Use of TI products in such applications requires the written approval of an appropriate TI officer. Questions concerning potential risk applications should be directed to TI through a local SC sales office.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein. Nor does TI warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
