- **4-Bit Counters/Registers**
- Multiplexed Outputs for Counter or Latched Data
- **3-State Outputs Drive Bus Lines Directly**
- 'LS696 . . Decade Counter. Direct Clear 'LS697 . . Binary Counter, Direct Clear 'LS699 . . Binary Counter, Synchronous Clear

#### description

These low-power Schottky LSI devices incorporate synchronous up/down counters, four-bit D-type registers, and quadruple two-line to one-line multiplexers with three state outputs in a single 20-pin package. The up/down counters are programmable from the data inputs and feature enable  $\overline{P}$  and enable  $\overline{T}$  and a ripple-carry output for easy expansion. The register/counter select input  $R/\overline{C}$ , selects the counter when low and the register when high for the three-state outputs, QA, QB, QC, and QD. These outputs are rated at 12 and 24 milliamperes (54LS/74LS) for good bus driving performance.

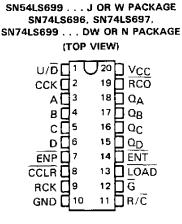

Both the counter CCK and register clock RCK are positiveedge triggered. The counter clear CCLR is active low and is asynchronous on the 'LS696 and 'LS697, synchronous on the 'LS699. Loading of the counter is accomplished when LOAD is taken low and a positive transition occurs on the counter clock CCK.

Expansion is easily accomplished by connecting RCO of the first stage to ENT of the second stage, etc. All ENP inputs can be tied common and used as a master

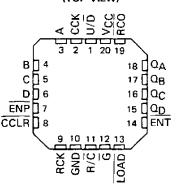

#### schematics of inputs and outputs

**PRODUCTION DATA** documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

<sup>†</sup> For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

<sup>4</sup> All typical values are at  $V_{CC} = 5 V$ ,  $T_A = 25^{\circ}C$ .

. '

 $\S$ Only one output should be shorted at a time, and duration of the short-circuit should not exceed one second,

NOTES: 3, I<sub>CCH</sub> is measured after two 4.5 V to 0 V to 4.5 V pulses have been applied to CCK and RCK while G is grounded and all other inputs are at 4.5 V.

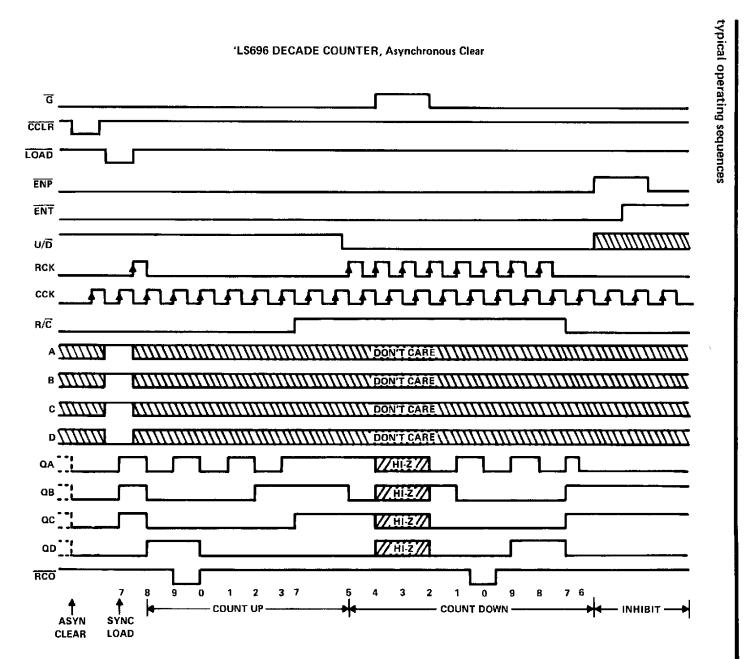

I<sub>CCL</sub> is measured after two 0 V to 4.5 V to 0 V pulses have been applied to CCK and RCK while all other inputs are grounded.
I<sub>CCZ</sub> is measured after two 0 V to 4.5 V to 0 V pulses have been applied to CCK and RCK while G is at 4.5 V and all other inputs are grounded.

### switching characteristics, $V_{CC} = 5 V$ , $T_{A} = 25^{\circ}C$ (see note 6)

NOTE 6: Load circuits and voltage waveforms are shown in Section 1.

#### **IMPORTANT NOTICE**

Texas Instruments (TI) reserves the right to make changes to its products or to discontinue any semiconductor product or service without notice, and advises its customers to obtain the latest version of relevant information to verify, before placing orders, that the information being relied on is current.

TI warrants performance of its semiconductor products and related software to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Certain applications using semiconductor products may involve potential risks of death, personal injury, or severe property or environmental damage ("Critical Applications").

TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS.

Inclusion of TI products in such applications is understood to be fully at the risk of the customer. Use of TI products in such applications requires the written approval of an appropriate TI officer. Questions concerning potential risk applications should be directed to TI through a local SC sales office.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein. Nor does TI warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
