## **TDA8356**

#### FEATURES

- Few external components
- Highly efficient fully DC-coupled vertical output bridge circuit
- Vertical flyback switch
- Guard circuit
- Protection against:
  - short-circuit of the output pins (7 and 4)
  - short-circuit of the output pins to  $V_{\mathsf{P}}$
- Temperature (thermal) protection
- High EMC immunity because of common mode inputs
- A guard signal in zoom mode.

#### QUICK REFERENCE DATA

#### GENERAL DESCRIPTION

The TDA8356 is a power circuit for use in  $90^{\circ}$  and  $110^{\circ}$  colour deflection systems for field frequencies of 50 to 120 Hz. The circuit provides a DC driven vertical deflection output circuit, operating as a highly efficient class G system.

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
DC supply	•	-			
V <sub>P</sub>	supply voltage	9	4.5	25	V
l <sub>q</sub>	quiescent supply current	-	30	-	mA
Vertical circuit		·		·	
I <sub>O(p-p)</sub>	output current (peak-to-peak value)	-	-	2	A
I <sub>diff(p-p)</sub>	differential input current (peak-to-peak value)	-	600	-	μΑ
V <sub>diff(p-p)</sub>	differential input voltage (peak-to-peak value)	-	1.5	1.8	V
Flyback switch					
I <sub>M</sub>	peak output current	-	_	±1	A
V <sub>FB</sub>	flyback supply voltage	-	-	50	V
Thermal data (ir	accordance with IEC 747-1)	·		·	
T <sub>stg</sub>	storage temperature	-55	-	+150	°C
T <sub>amb</sub>	operating ambient temperature	-25	-	+75	°C
T <sub>vj</sub>	virtual junction temperature	-	-	150	°C

## DC-coupled vertical deflection circuit

#### PINNING

SYMBOL	PIN	DESCRIPTION
I <sub>drive(pos)</sub>	1	input power-stage (positive); includes I <sub>I(sb)</sub> signal bias
I <sub>drive(neg)</sub>	2	input power-stage (negative); includes I <sub>I(sb)</sub> signal bias
VP	3	operating supply voltage
V <sub>O(B)</sub>	4	output voltage B
GND	5	ground
V <sub>FB</sub>	6	input flyback supply voltage
V <sub>O(A)</sub>	7	output voltage A
V <sub>O(guard)</sub>	8	guard output voltage
V <sub>I(fb)</sub>	9	input feedback voltage

#### FUNCTIONAL DESCRIPTION

The vertical driver circuit is a bridge configuration. The deflection coil is connected between the output amplifiers, which are driven in phase opposition. An external resistor (R<sub>M</sub>) connected in series with the deflection coil provides internal feedback information. The differential input circuit is voltage driven. The input circuit has been adapted to enable it to be used with the TDA9150, TDA9151B, TDA9160A, TDA9162, TDA8366 and TDA8376 which deliver symmetrical current signals. An external resistor (R<sub>CON</sub>) connected between the differential input determines the output current through the deflection coil. The relationship between the differential input current and the output current is defined by:  $I_{diff} \times R_{CON} = I_{coil} \times R_{M}$ . The output current is adjustable from 0.5 A (p-p) to 2 A (p-p) by varying R<sub>M</sub>. The maximum input differential voltage is 1.8 V. In the application it is recommended that V<sub>diff</sub> = 1.5 V (typ). This is recommended because of the spread of input current and the spread in the value of R<sub>CON</sub>.

The flyback voltage is determined by an additional supply voltage V<sub>FB</sub>. The principle of operating with two supply voltages (class G) makes it possible to fix the supply voltage V<sub>P</sub> optimum for the scan voltage and the second supply voltage V<sub>FB</sub> optimum for the flyback voltage. Using this method, very high efficiency is achieved.

The supply voltage  $V_{FB}$  is almost totally available as flyback voltage across the coil, this being possible due to the absence of a decoupling capacitor (not necessary, due to the bridge configuration). The output circuit is fully protected against the following:

- thermal protection
- short-circuit protection of the output pins (pins 4 and 7)
- short-circuit of the output pins to V<sub>P.</sub>

A guard circuit  $V_{O(guard)}$  is provided. The guard circuit is activated at the following conditions:

- during flyback
- during short-circuit of the coil and during short-circuit of the output pins (pins 4 and 7) to  $V_{\rm P}$  or ground
- during open loop
- · when the thermal protection is activated.

This signal can be used for blanking the picture tube screen.

### TDA8356

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT	
Guard circuit							
I <sub>O</sub>	output current	not active; V <sub>O(guard)</sub> = 0 V	-	-	50	μA	
		active; V <sub>O(guard)</sub> = 4.5 V	1	-	2.5	mA	
V <sub>O(guard)</sub>	output voltage on pin 8	I <sub>O</sub> = 100 μA	-	-	5.5	V	
	allowable voltage on pin 8	maximum leakage current = 10 μA;	-	-	40	V	

Notes

1. The linearity error is measured without S-correction and based on the same measurement principle as performed on the screen. The measuring method is as follows:

Divide the output signal  $I_4 - I_7 (V_{RM})$  into 22 equal parts ranging from 1 to 22 inclusive. Measure the value of two succeeding parts called one block starting with part 2 and 3 (block 1) and ending with part 20 and 21 (block 10). Thus part 1 and 22 are unused. The equations for linearity error for adjacent blocks (LEAB) and not adjacent blocks (NAB) are given below

$$\mathsf{LEAB} = \frac{\mathbf{a}_{k} - \mathbf{a}_{(k+1)}}{\mathbf{a}_{avg}} \text{ ; NAB } = \frac{\mathbf{a}_{max} - \mathbf{a}_{min}}{\mathbf{a}_{avg}}$$

2. Related to V<sub>P</sub>.

 V values within formulae, relate to voltages at or between relative pin numbers, i.e. V<sub>7-4</sub>/V<sub>1-2</sub> = voltage value across pins 7 and 4 divided by voltage value across pins 1 and 2.

4. V<sub>9-4</sub> AC short-circuited.

5. Frequency response  $V_{7-4}/V_{9-4}$  is equal to frequency response  $V_{7-4}/V_{1-2}$ .

6. At  $V_{(ripple)}$  = 500 mV eff; measured across  $R_M$ ;  $f_i$  = 50 Hz.
