**New In Car Entertainment (NICE) car radio****TEA6840H****FEATURES**

- FM mixer for conversion of FM RF from 65 to 108 MHz to IF of 10.7 MHz; the mixer provides inherent image rejection
- FM RF mixer can be set to receive weather band radio up to 162.55 MHz; weather band radio flag output
- AM mixer 1 for conversion of AM RF to AM IF1 10.7 MHz
- LC tuner oscillator providing mixer frequencies for FM mixer and AM mixer 1
- AM mixer 2 for conversion of AM IF1 to AM IF2 450 kHz
- Crystal oscillator providing mixer frequencies for AM mixer 2 and reference for synthesizer PLL, IF count, timing for Radio Data System (RDS) update and reference frequency for car audio signal processor IC
- Fast synthesizer PLL tuning system with local control for inaudible RDS updating
- Timing function for RDS update algorithm and control signal output for car audio signal processor ICs (TEA688x, SAA77xx)
- Digital alignment circuit for conversion of LC oscillator tuning voltage to controlled alignment voltage of FM antenna tank circuit
- AGC pin diode drive circuit for FM RF AGC; AGC detection at FM mixer input; the AGC pin diode drive can be activated by the I<sup>2</sup>C-bus as a local/distance function; AGC threshold is a programmable and keyed function switchable via the I<sup>2</sup>C-bus
- FM IF linear amplifiers with high dynamic input range
- FM quadrature demodulator with automatic centre frequency adjustment and Total Harmonic Distortion (THD) compensation

- Level detector for AM and FM with temperature compensated output voltage; starting point and slope of level output is programmable via the I<sup>2</sup>C-bus
- AM RF pin diode drive circuit; AGC threshold detection at AM mixer 1 and IF2 AGC input; threshold is programmable via the I<sup>2</sup>C-bus; AM IF2 AGC and demodulator
- AM AF output switchable to provide AM IF2 for AM stereo decoder
- AM noise blower with blanking at AM IF2
- Several test modes available for fast IC and system tests.

**GENERAL DESCRIPTION**

The TEA6840H is a single chip car radio tuner for AM and FM intended for microcontroller tuning with the I<sup>2</sup>C-bus providing the following functions:

- AM double conversion receiver for LW/MW/SW (31 m, 41 m and 49 m bands) with IF1 = 10.7 MHz and IF2 = 450 kHz
- FM single conversion receiver with integrated image rejection for IF = 10.7 MHz capable of selecting US FM, US weather, Europe FM, East Europe FM and Japan FM bands.

**ORDERING INFORMATION**

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
TEA6840H	QFP64	plastic quad flat package; 64 leads (lead length 1.95 mm); body 14 × 20 × 2.8 mm	SOT319-2

## PINNING

SYMBOL	PIN	DESCRIPTION
$V_{DDA1}$	1	analog supply voltage 1 (8.5 V) for on-chip power supply
$V_{DDA2}$	2	analog supply voltage 2 (5 V) for on-chip power supply
FMMPX	3	FM demodulator MPX output
RDSMPX	4	MPX for RDS decoder and signal processor (not muted)
AMAFIF2	5	AM demodulator AF output or IF2 for AM stereo (multiplexed by I <sup>2</sup> C-bus)
TRDSTMUTE	6	time constant for RDS update mute
AFHOLD	7	AF hold flag output for car audio signal processor IC
AFSAMPLE	8	AF sample flag output for car audio signal processor IC
$V_{DDA3}$	9	analog supply voltage 3 (8.5 V) for VCO
OSCTNK	10	VCO tank circuit
OSCFDB	11	VCO feedback
VCOGND	12	VCO ground
DGND	13	digital ground
$V_{DDD}$	14	digital supply voltage (5 V)
$f_{ref}$	15	reference frequency output for signal processor IC
$V_{DDA4}$	16	analog supply voltage 4 (8.5 V) for tuning PLL
CPOUT	17	charge pump output
$V_{tune}$	18	tuning voltage
DAAIN	19	input of digital alignment circuit for antenna tank circuit
DAATD	20	temperature compensation diode for digital alignment circuit of antenna tank circuit
DAAOUT	21	output of digital alignment circuit for antenna tank circuit
T1FMAGC	22	1st time constant of FM front-end AGC
T2FMAGC	23	2nd time constant of FM front-end AGC
IFMAGC	24	pin diode drive current output of FM front-end AGC
FMMIXIN1	25	input 1 of FM RF mixer
RFGND	26	RF ground
FMMIXIN2	27	input 2 of FM RF mixer
$V_{ref(FMMIX1)}$	28	reference voltage for FM mixer
IAMAGC	29	pin diode drive current output of AM front-end AGC
T2AMAGC	30	2nd time constant of AM front-end AGC
T1AMAGC	31	1st time constant output of AM front-end AGC
AMMIX1IN1	32	1st AM mixer input 1
AMMIX1IN2	33	1st AM mixer input 2
$V_{DDA5}$	34	analog supply voltage 5 (8.5 V) for FM and AM RF
MIX1OUT1	35	1st AM/FM mixer IF (10.7 MHz) output (HIGH)
MIX1OUT2	36	1st AM/FM mixer IF (10.7 MHz) output (LOW)
IFAMP1DEC	37	2nd AM mixer and 1st FM IF amplifier decoupling
$V_{DDA6}$	38	analog supply voltage 6 (8.5 V) for 1st and 2nd IF amplifier
IFAMP1IN	39	1st IF amplifier/2nd AM mixer (10.7 MHz) input
IFAMP1OUT	40	1st IF amplifier (10.7 MHz) output

### FUNCTIONAL DESCRIPTION

#### FM mixer 1

FM quadrature mixer converts FM RF (65 to 162.55 MHz) to an IF of 10.7 MHz. The FM mixer provides inherent image rejection and high RF sensitivity.

It is capable of tuning the US FM, US weather, Europe FM, Japan FM and East Europe FM bands.

- US FM = 87.9 to 107.9 MHz
- US weather = 162.4 to 162.55 MHz
- Europe FM = 87.5 to 108 MHz
- Japan FM = 76.0 to 91 MHz
- East Europe FM = 65.8 to 74 MHz.

#### VCO

The L and C tuned VCO provides the Local Oscillator (LO) signal for both FM and AM mixer 1. It has a frequency range of 151.2 to 248.2 MHz.

#### Crystal oscillator

The crystal oscillator provides a 20.5 MHz signal that is used for:

- Reference frequency for frequency synthesizer PLL
- LO for 2nd AM mixer
- Reference frequency for the IF counter
- Timing signal for the RDS update algorithm
- Reference frequency (75.4 kHz) for the TEA6880H.

#### PLL

Fast synthesizer PLL tuning system with local control for inaudible RDS updating.

#### DAA

Digital Auto Alignment circuitry (FM RF DAA) for the conversion of the VCO tuning voltage to a controlled alignment voltage for the FM antenna tank circuit.

#### FM keyed AGC

FM contains keyed wide-band RF AGC. AGC detection occurs at the FM mixer. The wide-band RF signal switches a narrow band signal (IF) from the FM IF level detector circuitry that controls the FM RF AGC block.

It includes an AGC pin diode drive circuit for the FM RF AGC. The pin diode drive can be activated via the I<sup>2</sup>C-bus as a local/distance function.

The AGC threshold is programmable and the keyed AGC function is switchable via the I<sup>2</sup>C-bus.

#### FM IF amplifiers

The two FM IF amplifiers provide 10 dB and 4 dB amplification with high linearity and dynamic range.

#### FM demodulator

The FM quadrature demodulator includes automatic centre frequency adjustment and THD compensation.

#### AM tuner

The AM tuner is realized in a double conversion technique and is capable of selecting LW/MW and SW bands.

AM mixer 1 converts AM RF to an IF1 of 10.7 MHz, while AM mixer 2 converts 10.7 MHz IF1 to 450 kHz IF2.

- LW = 144 to 288 kHz
- MW = 530 to 1710 kHz (US AM band)
- SW = 5.85 to 9.99 MHz (including the 31 m, 41 m and 49 m bands).

#### AM RF and IF2 AGC

The AM RF includes a pin diode drive circuit.

The threshold detection points for AM AGC are performed at AM mixer 1 and AM IF2. AGC thresholds are programmable via the I<sup>2</sup>C-bus.

#### AM detector

The AM detector provides AM level information and AM AF or AM IF2.

#### AM AF/IF2 SWITCH

The AM output provides either a detected AM Audio Frequency (AF) or the corresponding AM IF2 signal. The IF2 signal can be used for AM stereo decoder processing.

#### AM noise blanker

The detection point for the AM noise blanker is the output stage of AM mixer 1, while blanking is realized at the output of the 2nd mixer.

Trigger sensitivity can be modified by changing the resistor value at pin 46.

## New In Car Entertainment (NICE) car radio

TEA6840H

### FM/AM level detector

FM and AM level detectors provide the temperature compensated output voltage. The starting points and slopes of the level detector outputs are programmable via the I<sup>2</sup>C-bus.

### Test mode

The test mode of the IC is activated by:

- Sending the test byte (byte 5) to the IC
- Connecting pin 15 through a 100 kΩ resistor to V<sub>DDA1</sub>
- Applying 50 μA to pin 15.

If the test mode is enabled by pin 15:

- The settling time of the AM IF2 AGC is reduced to less than 100 ms in the nominal application

- The digital-to-analog converters for the antenna Data Access Arrangement (DAA) and the level DAA can be clocked directly by the SCL line of the I<sup>2</sup>C-bus
- The output at pin 15 can be selected by the I<sup>2</sup>C-bus: TEA6880H reference frequency, PLL reference frequency or PLL programmable divider output frequency
- The RDS update control circuit can be clocked directly via pin 20
- Pin 31 can be used to enable the load PLL circuit of the RDS update control circuit
- Charge pumps can be set into 3-state mode.

### LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

TEA6840H

### I<sup>2</sup>C-BUS AND I<sup>2</sup>C-BUS CONTROLLED FUNCTIONS

#### I<sup>2</sup>C-bus specification

The standard I<sup>2</sup>C-bus specification is expanded by the following definitions.

- 1st chip address C2: 1100001 R/W
- 2nd chip address C0: 1100000 R/W.

Structure of the I<sup>2</sup>C-bus logic: slave transceiver with auto increment.

Subaddresses are not used.

A second I<sup>2</sup>C-bus address can be selected by connecting pin 15 via a 68 kΩ resistor to GND.

Connecting pin 15 to V<sub>DDA1</sub> via a 100 kΩ resistor or feeding 50 μA into that pin switches the IC into the test mode.

#### TEST MODE

During test mode the digital-to-analog converters of the level and antenna DAA functions can be sequenced by the I<sup>2</sup>C-bus SCL line.

During test mode either the TEA6880H reference frequency, the PLL reference frequency divider or the programmable divider output can be switched to pin 15.

#### DATA TRANSFER FOR THE TEA6840H

Data sequence:

- Address
- Byte 1
- Byte 2
- Byte 3
- Byte 4
- Byte 5
- Byte 6.

The data transfer has to be in this order. The LSB = 0 indicates a WRITE operation to the TEA6840H. Bit 7 of each byte is considered the MSB and has to be transferred as the first bit of the byte.

The data becomes valid at the output of the internal latches with the acknowledge of each byte. A STOP condition after any byte can shorten transmission times.

When writing to the transceiver by using the STOP condition before completion of the whole transfer:

- The remaining bytes will contain the old information
- If the transfer of a byte is not completed, this byte is lost and the previous information is available.

In byte 5, 4 bits are reserved for test mode purposes. Those can only be used when the test mode is activated by the select pin 15.

**Hints:** When the IC is used together with the Car Analog Sound Processor IC (TEA6880H) and when the SCL and SDA lines are connected via Car Analog Sound Processor IC's I<sup>2</sup>C-bus buffer interface, the pull-up resistors of the tuner IC should be connected to the digital supply voltage of the TEA6880H. Otherwise a bus pull-down can occur switching off the tuner IC supply when the I<sup>2</sup>C-bus buffer interface of the TEA6880H is enabled for data transfer to the tuner IC.

For new frequency setting, in both AM and FM mode, the programmable divider is enabled by setting the mute bit (data byte 3 bit 7) to logic 1.

To select an FM frequency, two I<sup>2</sup>C-bus transmissions are necessary. First data byte 3 bit 7 = 1 and second data byte 3 bit 7 = 0.

**Default settings by power-on reset:** To be defined.

## New In Car Entertainment (NICE) car radio

### SOLDERING

#### Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

#### Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 250 °C. The top-surface temperature of the packages should preferably be kept below 230 °C.

#### Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

#### Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

## New In Car Entertainment (NICE) car radio

TEA6840H

**Suitability of surface mount IC packages for wave and reflow soldering methods**

PACKAGE	SOLDERING METHOD	
	WAVE	REFLOW <sup>(1)</sup>
BGA, SQFP	not suitable	suitable
HLQFP, HSQFP, HSOP, HTSSOP, SMS	not suitable <sup>(2)</sup>	suitable
PLCC <sup>(3)</sup> , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended <sup>(3)(4)</sup>	suitable
SSOP, TSSOP, VSO	not recommended <sup>(5)</sup>	suitable

**Notes**

1. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the "Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods".
2. These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
3. If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
4. Wave soldering is only suitable for LQFP, TQFP and QFP packages with a pitch (e) equal to or larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
5. Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.

### DEFINITIONS

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

### LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

### PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
