

Low-Drop Voltage Regulator

TLE 4276

Features

- Output voltage tolerance $\leq \pm 4\%$
- Low-drop voltage
- Inhibit input
- Very low current consumption
- Short-circuit-proof
- Reverse polarity proof
- Suitable for use in automotive electronics

Functional Description

The TLE 4276 is a low-drop voltage regulator in a TO220 package. The IC regulates an input voltage up to 40 V to $V_{Q\text{rated}} = 5.0 \text{ V}$ (V50), 8.5 V (V85), 10 V (V10) and adjustable voltage (V). The maximum output current is 400 mA. The IC can be switched off via the inhibit input, which causes the current consumption to drop below 10 μA . The IC is short-circuit-proof and incorporates temperature protection that disables it at over-temperature.

Dimensioning Information on External Components

The input capacitor C_I is necessary for compensating line influences. Using a resistor of approx. 1 Ω in series with C_I , the oscillating of input inductivity and input capacitance can be damped. The output capacitor C_Q is necessary for the stability of the regulation circuit. Stability is guaranteed at values $C_Q \geq 22 \mu\text{F}$ and an ESR of $\leq 3 \Omega$ within the operating temperature range.

Circuit Description

The control amplifier compares a reference voltage to a voltage that is proportional to the output voltage and drives the base of the series transistor via a buffer. Saturation control as a function of the load current prevents any oversaturation of the power element. The IC also incorporates a number of internal circuits for protection against:

- Overload
- Overtemperature
- Reverse polarity

Pin Definitions and Functions

Pin No.	Symbol	Function
1	I	Input ; block to ground directly at the IC with a ceramic capacitor.
2	INH	Inhibit ; low-active input
3	GND	Ground
4	N.C. VA	Not connected for V50, V85, V10 Voltage Adjust Input ; only for adjustable output from external voltage divider.
5	Q	Output ; block to ground with a $\geq 22 \mu\text{F}$ capacitor.
