

Low Voltage Precision Air-Core Tach/Speedo Driver

Description

The CS4121 is specifically designed for use with air-core meter movements. The IC provides all the functions necessary for an analog tachometer or speedometer. The CS4121 takes a speed sensor input and generates sine and cosine related output signals to differentially drive an air-core meter.

Many enhancements have been added over industry standard tachometer drivers such as the CS289 or LM1819. The output utilizes differential drivers which elim-

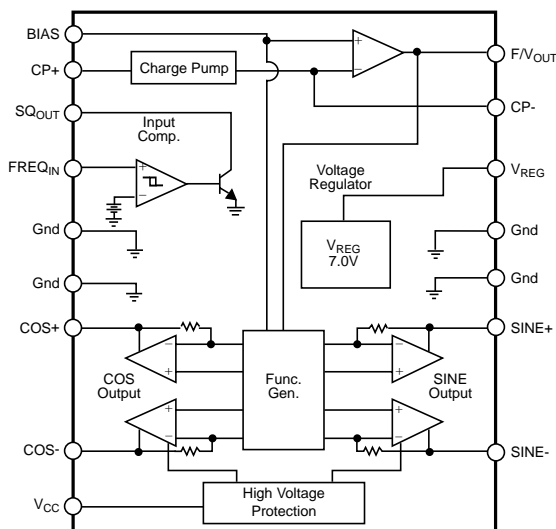

inates the need for a zener reference and offers more torque. The device withstands 60V transients which decreases the protection circuitry required. The device is also more precise than existing devices allowing for fewer trims and for use in a speedometer.

The CS4121 is compatible with the CS8190, and provides higher accuracy at a lower supply voltage (8.0V min. as opposed to 8.5V). It is functionally operational to 6.5V.

Absolute Maximum Ratings

Supply Voltage (<100ms pulse transient).....	V _{CC} = 60V
(continuous)	V _{CC} = 24V
Operating Temperature	-40°C to +105°C
Storage Temperature	-40°C to +165°C
Junction Temperature	-40°C to +150°C
ESD (Human Body Model)	4kV
Lead Temperature Soldering	
Wave Solder (through hole styles only).....	10 sec. max, 260°C peak
Reflow (SMD styles only).....	60 sec. max above 183°C, 230°C peak

Block Diagram

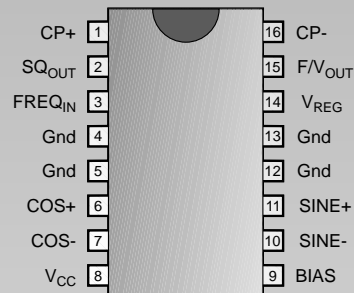

Features

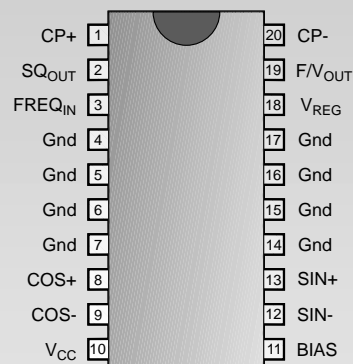

- Direct Sensor Input
- High Torque Output
- Low Pointer Flutter
- High Input Impedance
- Overvoltage Protection
- Accurate to 8V Functional to 6.5V (typ)

Package Options

16 Lead PDIP (internally fused leads)

20 Lead SOIC (internally fused leads)

Electrical Characteristics: $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, $8.0\text{V} \leq V_{CC} \leq 16\text{V}$ unless otherwise specified.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT

Note: Temperature, voltage and nonlinearity not included.

The CS4121 is specifically designed for use with air-core meter movements. It includes an input comparator for sensing an input signal from an ignition pulse or speed sensor, a charge pump for frequency to voltage conversion, a bandgap voltage regulator for stable operation, and a function generator with sine and cosine amplifiers to differentially drive the motor coils.

From the simplified block diagram of Figure 5A, the input signal is applied to the $FREQ_{IN}$ lead, this is the input to a high impedance comparator with a typical positive input threshold of 2.0V and typical hysteresis of 0.5V. The output of the comparator, SQ_{OUT} , is applied to the charge pump input $CP+$ through an external capacitor C_T . When the input signal changes state, C_T is charged or discharged through R_3 and R_4 . The charge accumulated on C_T is mirrored to C_4 by the Norton Amplifier circuit comprising of Q_1 , Q_2 and Q_3 . The charge pump output voltage, F/V_{OUT} , ranges from 2V to 6.3V depending on the input signal frequency and the gain of the charge pump according to the formula:

$$F/V_{OUT} = 2.0V + 2 \times FREQ \times C_T \times R_T \times (V_{REG} - 0.7V)$$

R_T is a potentiometer used to adjust the gain of the F/V output stage and give the correct meter deflection. The F/V output voltage is applied to the function generator which generates the sine and cosine output voltages. The output voltage of the sine and cosine amplifiers are derived from the on-chip amplifier and function generator circuitry. The various trip points for the circuit (i.e., 0° , 90° , 180° , 270°) are determined by an internal resistor divider and the bandgap voltage reference. The coils are differentially driven, allowing bidirectional current flow in the outputs, thus providing up to 305° range of meter deflection. Driving the coils differentially offers faster response time, higher current capability, higher output voltage swings, and reduced external component count. The key advantage is a higher torque output for the pointer.

The output angle, Θ , is equal to the F/V gain multiplied by the function generator gain:

$$\Theta = A_{F/V} \times A_{FG},$$

where:

$$A_{FG} = 77^\circ/V \text{ (typ)}$$

The relationship between input frequency and output angle is:

$$\Theta = A_{FG} \times 2 \times FREQ \times C_T \times R_T \times (V_{REG} - 0.7V)$$

$$\text{or, } \Theta = 970 \times FREQ \times C_T \times R_T$$

The ripple voltage at the F/V converter's output is determined by the ratio of C_T and C_4 in the formula:

$$\Delta V = \frac{C_T(V_{REG} - 0.7V)}{C_4}$$

Ripple voltage on the F/V output causes pointer or needle flutter especially at low input frequencies.

The response time of the F/V is determined by the time constant formed by R_T and C_4 . Increasing the value of C_4 will reduce the ripple on the F/V output but will also increase the response time. An increase in response time causes a very slow meter movement and may be unacceptable for many applications.

Design Example

Maximum meter Deflection = 270°

Maximum Input Frequency = 350Hz

1. Select R_T and C_T

$$\Theta = A_{GEN} \times \Delta_{F/V}$$

$$\Delta_{F/V} = 2 \times FREQ \times C_T \times R_T \times (V_{REG} - 0.7V)$$

$$\Theta = 970 \times FREQ \times C_T \times R_T$$

Let $C_T = 0.0033\mu F$, Find R_T

$$R_T = \frac{270^\circ}{970 \times 350\text{Hz} \times 0.0033\mu F}$$

$$R_T = 243k\Omega$$

R_T should be a 250k Ω potentiometer to trim out any inaccuracies due to IC tolerances or meter movement pointer placement.

2. Select R_3 and R_4

Resistor R_3 sets the output current from the voltage regulator. The maximum output current from the voltage regulator is 10mA R_3 must ensure that the current does not exceed this limit.

Choose $R_3 = 3.3k\Omega$

The charge current for C_T is

$$\frac{V_{REG} - 0.7V}{3.3k\Omega} = 1.90\text{mA}$$

C_1 must charge and discharge fully during each cycle of the input signal. Time for one cycle at maximum frequency is 2.85ms. To ensure that C_T is discharged, assume that the $(R_3 + R_4) C_T$ time constant is less than 10% of the minimum input frequency pulse width.

$$T = 285\mu s$$

Choose $R_4 = 1k\Omega$.

Charge time: $T = R_3 \times C_T = 3.3k\Omega \times 0.0033\mu F = 10.9\mu s$

Discharge time: $T = (R_3 + R_4) C_T = 4.3k\Omega \times 0.0033\mu F = 14.2\mu s$

3. Determine C_4

C_4 is selected to satisfy both the maximum allowable ripple voltage and response time of the meter movement.

$$C_4 = \frac{C_T(V_{REG} - 0.7V)}{V_{RIPPLE(MAX)}}$$

With $C_4 = 0.47\mu F$, the F/V ripple voltage is 44mV.

Figure 7 shows how the CS4121 and the CS-8441 are used to produce a Speedometer and Odometer circuit.
