SONY

LCX007BK

3.4cm (1.35-inch) Color LCD Panel

Description

The LCX007AK is a 3.4cm diagonal active matrix TFT-LCD panel addressed by polycrystalline silicon super thin film transistors with built-in peripheral driving circuit, and it provides a full-color representation is possible.

This panel provides a wide aspect ratio of 16:9, such as those represented in HD. The built-in sideblack function also allows an aspect ratio of 4:3 in the NTSC/PAL mode.

This panel has a polysilicon TFT high-speed scanner and built-in function to display images up/down and/or right/left inverse. The built-in 5V interface circuit leads to lower voltage of timing system and control signals.

Features

- The number of active dots: 512,880 (1.35-inch; 3.4cm in diagonal)
- Horizontal resolution: 400 TV lines
- High optical transmittance: 4.0% (typ.)
- High contrast ratio with normally white mode: 190 (typ.)
- Built-in H and V drivers (built-in input level conversion circuit, 5V driving possible)
- NTSC/NTSC-WIDE/HD (band: 20MHz) mode selectable (PAL/PAL-WIDE mode also available through conversion of scanned dot numbers by an external IC)
- Up/down and/or right/left inverse display function
- Side-black function
- 16:9 and 4:3 aspect-ratio switching function
- Full-color display

Element Structure

Dots

16:9 display: 1068.5 (H) × 480 (V) = 512,880 4:3 display: 799.5 (H) × 480 (V) = 383,760

• Built-in peripheral driver using polycrystalline silicon super thin film transistors.

Applications

Liquid crystal projectors, etc.

Input Equivalent Circuit

To prevent static charges, protective diodes are provided for each pin except the power supply. In addition, protective resistors are added to all pins except video signal input. All pins are connected to Vss with a high resistance of $1M\Omega$ (typ.). The equivalent circuit of each input pin is shown below: (The resistor value: typ.)

Input Signals

1. Input signal voltage conditions

I. Input signal voltage conditions (Vss = 0)							
Item		Symbol	Min.	Тур.	Max.	Unit

1. Contrast Ratio

Contrast Ratio (CR) is given by the following formula (1).

$$CR = \frac{L (White)}{L (Black)} \dots (1)$$

L (White): Surface luminance of the TFT-LCD panel at the input signal amplitude $V_{AC} = 0.5V$.

L (Black): Surface luminance of the panel at $V_{AC} = 4.5V$.

Both luminosities are measured by System I.

2. Optical Transmittance

Optical Transmittance (T) is given by the following formula (2).

 $T = \frac{L \text{ (White)}}{\text{Luminance of Back Light}} \times 100 \text{ [\%]} \dots \text{ (2)}$

L (White) is the same expression as defined in the 'Contrast Ratio' section.

3. Chromaticity

Chromaticity of the panels are measured by System I. Raster modes of each color are defined by the representations at the input signal amplitude conditions shown in the table below. System I uses Chromaticity of x and y on the CIE standards here.

\searrow		Signal amplitudes (VAc) supplied to each input				
		R input	G input	B input		
Raster	R	0.5	4.5	4.5		
	G	4.5	0.5	4.5		
	B 4.5		4.5	0.5		

(Unit: V)

4. V-T Characteristics

V-T characteristics, the relationship between signal amplitude and the transmittance of the panels, are measured by System II. V_{90} , V_{50} and V_{10} correspond to the each voltage which defines 90%, 50% and 10% of transmittance respectively.

VAC - Signal amplitude [V]

5. Half Tone Color Reproduction Range

Half tone color reproduction range of the LCD panels is characterized by the defferences between the V-T characteristics of R, G and B. The differences of these V-T characteristics are measured by System II. System II defines signal voltages of each R, G, B raster modes which corresponds to 50% of transmittance, V_{50R}, V_{50G} and V_{50B} respectively. V_{50RG} and V_{50BG}, the voltage differences between V_{50R} and V_{50BG}, the voltage simply given by the following formula (3) and (4) respectively.

V50RG = V50R-V50G ... (3) V50BG = V50B-V50G ... (4)

6. Response Time

Response time 'ton' and 'toff' are defined by the formula (5) and (6) respectively.

ton = t1 - tON ... (5)toff = t2 - tOFF ... (6)

- t1: time which gives 10% transmittance of the panel.
- t2: time which gives 90% transmittance of the panel.

The relationships between t1, t2, tON and tOFF are shown in the right figure.

Input signal voltage (waveform applied to the measured pixels)

7. Flicker

Flicker (F) is given by the formula (7). DC and AC (NTSC: 30Hz, rms, PAL: 25Hz, rms) components of the panel output signal for gray raster^{*} mode are measured by a DC voltmeter and a spectrum analyzer in System II.

$$F [dB] = 20 \log \left\{ \frac{AC \text{ component}}{DC \text{ component}} \right\} ... (7)$$
* Each input signal condition for gray raster mode is given by
$$Vsig = 7.0 \pm V_{50} [V]$$
where: V₅₀ is the signal amplitude which gives 50% of

transmittance in V-T characteristics.

8. Image Retention Time

Image Retention time is given by following procedures.

Apply the monoscope signal to the LCD panel for 60 minutes and then change this signal to the gray scale of Vsig = $7.0 \pm Vac$ (Vac: 3 to 4V). Hold Vac that maximizes image retention judging by sight. Measure the time till the residual image becomes indistinct.

(shown in the right figure) Vcom = 6.6V

Vsig waveform

Viewing angle characteristics (Typical value)

1. Dot Arrangement (1) (16:9 display)

The dots are arranged in a delta pattern. The shaded area is used for the dark border around the display. The R corresponds to SIG2, G to SIG1, and B to SIG3, respectively

The dots are arranged in a delta pattern. The shaded area is used for the dark border around the display. The R corresponds to SIG2, G to SIG1, and B to SIG3, respectively.

2. LCD Panel Operations

[Description of basic operations]

The basic operations of the LCD panel are shown below based on the wide-display mode.

- A vertical driver, which consists of vertical shift registers, enable-gates and buffers, applies a selected pulse to every 480 gate lines sequentially in every horizontal scanning period.
- A horizontal driver, which consists of horizontal shift registers, gates and CMOS sample-and-hold circuits, applies selected pulses to every 1068.5 signal electrodes sequentially in a single horizontal scanning period.
- Vertical and horizontal shift registers address one pixel, and then turn on Thin Film Transistors (TFTs; two TFTs) to apply a video signal to the dot. The same procedures lead to the entire 480 × 1068.5 dots to display a picture in a single vertical scanning period.
- The LCD pixel dots are arranged in a delta pattern, where the dots connected to the identical signal line are positioned with 1.5-dot offset against those of the adjacent horizontal line. Horizontal Start Pulse (HST) is generated with 1.5-bit offset between the horizontal lines to regulate the above offset. HCK and sample-hold (S/H) pulses follow the same 1.5-bit offset scheme.
- The CLR pin is provided to eliminate the shading effect caused by the coupling of selected pulses. While maintaining the CLR at High level, the VV_{DD} potential drops to approximately 9.5V. This pin shall be grounded when not in use.
- The video signal shall be input with polarity-inverted system in every horizontal cycle.
- Timing diagrams of the vertical and the horizontal display cycle are shown below:

[Description of operating mode]

The LCD panel has the following functions to easily apply to various uses, as well as various broadcasting systems.

- Right/left inverse mode
- Up/down inverse mode
- 4:3 display mode with side-black display

These modes are controlled by three signals (RGT, DWN, and WID). The setting mode is shown below:

WID	RGT	Mode
н	Н	16:9 right scan
н	L	16:9 left scan
L	Н	4:3 right scan
L	L	4:3 left scan

H Dow	n scan	
L Up s	Up scan	

The direction of the right/left and/or up/down mean when Pin 1 marking is located at right side with the pin block upside.

• The analog signal (SID) to display side-black shall be input by 1H inversion synchronized with the signal.

3. 3-dot Simultaneous Sampling

Horizontal driver samples SIG1, SIG2 and SIG3 signal simultaneously, which requires the phase matching between SIG1, SIG2, and SIG3 signals to prevent horizontal resolution from deteriorating. Thus phase matching between each signal is required using an external signal delaying circuit before applying video signal to the LCD panel.

The block diagram of the delaying procedure using sample-and-hold method is as follows.

The LCX007 has the right/left inverse function. The following phase relationship diagram indicates the phase setting for the right scan (RGT = High level). For the left scan (RGT = Low level), the phase setting shall be inverted between SIG2 and SIG3 signals.

<Phase relationship of delaying sample-and-hold pulses> (right scan)

Vibration	X, Y, Z, 1.5mm 10 to 55Hz (1min. reciprocation)	20min. for each direction		

Important

(1) Anti-reflection coating

Use anti-reflection coating when using a phase-shifting plate on a light egress side of the LCD to align a polarization axis with those of a polarization screen or a prism.

(2) Direction of incident light

Allow incident light to hit upon an opposite side of a mark-indicated surface.

(3) Polarizer

This LCD is attached with a polarizer on a light egress side. A suitable heat-dissipation method shall be incorporated to suppress optical degradation of a polarizer.

- (4) Light source
 - Use visible light (wavelength λ = 400 to 780nm) as a light source. Do not use a light source containing infrared or ultraviolet components.
 - Suppress leakage light (reflection light) into a backside of a panel to sufficiently weak level or shut it out completely.

Notes on Handling

(1) Static charge prevention

Be sure to take following protective measures. TFT-LCD panels are easily damaged by static charge.

- a) Use non-chargeable gloves, or simply use bare hands.
- b) Use an earth-band when handling.
- c) Do not touch any electrodes of a panel.
- d) Wear non-chargeable clothes and conductive shoes.
- e) Install conductive mat on the working floor and working table.
- f) Keep panels away from any charged materials.
- g) Use ionized air to discharge the panels.
- (2) Protection from dust and dirt
 - a) Handle in clean environment.
 - b) When delivered, a surface of a panel (Polarizer) is covered by a protective sheet. Peel off the protective sheet carefully not to damage the panel.
 - c) Do not touch the surface of a panel. The surface is easily scratched. When cleaning, use a clean-room wiper with isopropyl alcohol. Be careful not to leave stain on the surface.
 - d) Use ionized air to blow off dust at a panel.
- (3) Other handling precautions
 - a) Do not twist or bend the flexible PC board especially at the connecting region because the board is easily deformed.
 - b) Do not drop a panel.
 - c) Do not twist or bend a panel or a panel frame.
 - d) Keep a panel away from heat source.
 - e) Do not dampen a panel with water or other solvents.
 - f) Avoid to store or to use a panel in a high temperature or in a high humidity, which may result in panel damages.
 - g) Minimum bent radius rating for flexible substrate is 1mm.
 - h) Panel screw torque should not exceed 3kg · cm.

Package Outline Unit: mm

The rotation angle of the active area relative to H and V is $\pm 1^{\circ}$.
