Triple Line Receiver

The MC10114 is a triple line receiver designed for use in sensing differential signals over long lines. An active current source and translated emitter follower inputs provide the line receiver with a common mode noise rejection limit of one volt in either the positive or the negative direction. This allows a large amount of common mode noise immunity for extra long lines.

Another feature of the MC10114 is that the OR outputs go to a logic low level whenever the inputs are left floating. The outputs are each capable of driving 50 ohm transmission lines.

This device is useful in high speed central processors, minicomputers, peripheral controllers, digital communication systems, testing and instrumentation systems. The MC10114 can also be used for MOS to MECL interfacing and it is ideal as a sense amplifier for MOS RAM's.

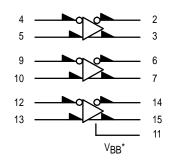

A VBB reference is provided which is useful in making the MC10114 a Schmit trigger, allowing single—ended driving of the inputs, or other applications where a stable reference voltage is necessary. See MECL Design Handbook (HB205) pages 226 and 228.

P_D = 145 mW typ/pkg t_{pd} = 2.4 ns typ (Single Ended Input)

 $t_{pd} = 2.0 \text{ ns typ (Differential Input)}$

 t_f , $t_f = 2.1$ ns typ (20% to 80%)

LOGIC DIAGRAM

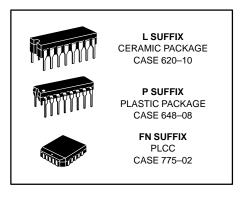

V_{CC1} = PIN 1 V_{CC2} = PIN 16 V_{EE} = PIN 8

 $^*V_{BB}$ to be used to supply bias to the MC10114 only and bypassed (when used) with 0.01 μF to 0.1 μF capacitor to ground (0 V). V_{BB} can source < 1.0 mA.

When the input pin with the bubble goes positive, its respective output pin with bubble goes positive.

MC10114

DIP PIN ASSIGNMENT

Pin assignment is for Dual–in–Line Package.
For PLCC pin assignment, see the Pin Conversion
Tables on page 6–11 of the Motorola MECL Data
Book (DL122/D).

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.
