Quad 2-Input NAND Schmitt Trigger

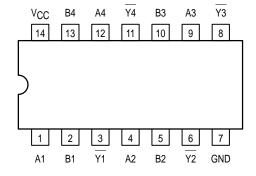

The MC74VHC132 is an advanced high speed CMOS Schmitt NAND trigger fabricated with silicon gate CMOS technology. It achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining CMOS low power dissipation.

Pin configuration and function are the same as the MC74VHC00, but the inputs have hysteresis and, with its Schmitt trigger function, the VHC132 can be used as a line receiver which will receive slow input signals.

The internal circuit is composed of three stages, including a buffer output which provides high noise immunity and stable output. The inputs tolerate voltages up to 7V, allowing the interface of 5V systems to 3V systems.

- High Speed: tpD = 4.9ns (Typ) at VCC = 5V
- Low Power Dissipation: I_{CC} = 2μA (Max) at T_A = 25°C
- High Noise Immunity: V_{NIH} = V_{NIL} = 28% V_{CC}
- · Power Down Protection Provided on Inputs
- · Balanced Propagation Delays
- Designed for 2V to 5.5V Operating Range
- Low Noise: Volp = 0.8V (Max)
- · Pin and Function Compatible with Other Standard Logic Families
- Latchup Performance Exceeds 300mA
- ESD Performance: HBM > 2000V; Machine Model > 200V
- Chip Complexity: 72 FETs or 18 Equivalent Gates

LOGIC DIAGRAM

MAXIMUM RATINGS*

Symbol	Parameter		Value	Unit
VCC	DC Supply Voltage		- 0.5 to + 7.0	V
V _{in}	DC Input Voltage		- 0.5 to + 7.0	V
V _{out}	DC Output Voltage		-0.5 to V _{CC} + 0.5	V
lικ	Input Diode Current		- 20	mA
lok	Output Diode Current		± 20	mA
l _{out}	DC Output Current, per Pin		± 25	mA
ICC	DC Supply Current, V _{CC} and GN	D Pins	± 50	mA
PD	Power Dissipation in Still Air,	SOIC Packages† TSSOP Package†	500 450	mW
T _{stg}	Storage Temperature		- 65 to + 150	°C

^{*} Absolute maximum continuous ratings are those values beyond which damage to the device may occur. Exposure to these conditions or conditions beyond those indicated may adversely affect device reliability. Functional operation under absolute—maximum—rated conditions is not implied.

†Derating — SOIC Packages: – 7 mW/°C from 65° to 125°C TSSOP Package: – 6.1 mW/°C from 65° to 125°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND \leq (V_{in} or V_{out}) \leq VCC. Unused inputs must always be tied to an appropriate logic voltage

level (e.g., either GND or V_{CC}). Unused outputs must be left open.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
VCC	DC Supply Voltage	2.0	5.5	V

		Typical @ 25°C, V _{CC} = 5.0 V	
C_{PD}	Power Dissipation Capacitance (Note NO TAG)	16	pF

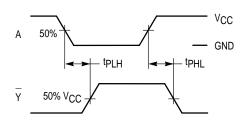

^{1.} C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation: I_{CC(OPR)} = C_{PD} • V_{CC} • f_{in} + I_{CC}/4 (per gate). C_{PD} is used to determine the no–load dynamic power consumption; P_D = C_{PD} • V_{CC}² • f_{in} + I_{CC} • V_{CC}.
