

## Features

- High-performance, Low-power Atmel® AVR® 8-bit Microcontroller
- Advanced RISC Architecture
  - 130 Powerful Instructions – Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers + Peripheral Control Registers
  - Fully Static Operation
  - Up to 16 MIPS Throughput at 16 MHz
  - On-chip 2-cycle Multiplier
- High Endurance Non-volatile Memory segments
  - 64 Kbytes of In-System Reprogrammable Flash program memory
  - 2 Kbytes EEPROM
  - 4 Kbytes Internal SRAM
  - Write/Erase Cycles: 10,000 Flash/100,000 EEPROM
  - Data retention: 20 years at 85°C/100 years at 25°C<sup>(1)</sup>
  - Optional Boot Code Section with Independent Lock Bits
  - In-System Programming by On-chip Boot Program
  - True Read-While-Write Operation
  - Up to 64 Kbytes Optional External Memory Space
  - Programming Lock for Software Security
  - SPI Interface for In-System Programming
- JTAG (IEEE std. 1149.1 Compliant) Interface
  - Boundary-scan Capabilities According to the JTAG Standard
  - Extensive On-chip Debug Support
  - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
- Peripheral Features
  - Two 8-bit Timer/Counters with Separate Prescalers and Compare Modes
  - Two Expanded 16-bit Timer/Counters with Separate Prescaler, Compare Mode, and Capture Mode
  - Real Time Counter with Separate Oscillator
  - Two 8-bit PWM Channels
  - 6 PWM Channels with Programmable Resolution from 1 to 16 Bits
  - 8-channel, 10-bit ADC
    - 8 Single-ended Channels
    - 7 Differential Channels
    - 2 Differential Channels with Programmable Gain (1x, 10x, 200x)
  - Byte-oriented Two-wire Serial Interface
  - Dual Programmable Serial USARTs
  - Master/Slave SPI Serial Interface
  - Programmable Watchdog Timer with On-chip Oscillator
  - On-chip Analog Comparator
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated RC Oscillator
  - External and Internal Interrupt Sources
  - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby and Extended Standby
  - Software Selectable Clock Frequency
  - ATmega103 Compatibility Mode Selected by a Fuse
  - Global Pull-up Disable
- I/O and Packages
  - 53 Programmable I/O Lines
  - 64-lead TQFP and 64-pad QFN/MLF
- Operating Voltages
  - 2.7V - 5.5V for ATmega64L
  - 4.5V - 5.5V for ATmega64
- Speed Grades
  - 0 - 8 MHz for ATmega64L
  - 0 - 16 MHz for ATmega64

## Overview

The ATmega64 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega64 achieves throughputs approaching 1 MIPS per MHz, allowing the system designer to optimize power consumption versus processing speed.

## Block Diagram

Figure 2. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega64 provides the following features: 64 Kbytes of In-System Programmable Flash with Read-While-Write capabilities, 2 Kbytes EEPROM, 4 Kbytes SRAM, 53 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, two USARTs, a byte oriented Two-wire Serial Interface, an 8-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming, and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except asynchronous timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the asynchronous timer continue to run.

The device is manufactured using Atmel's high-density non-volatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, by a conventional non-volatile memory programmer, or by an On-chip Boot program running on the AVR core. The Boot Program can use any interface to download the Application Program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega64 is a powerful microcontroller that provides a highly-flexible and cost-effective solution to many embedded control applications.

The ATmega64 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, In-Circuit Emulators, and evaluation kits.

## **ATmega103 and ATmega64 Compatibility**

The ATmega64 is a highly complex microcontroller where the number of I/O locations supersedes the 64 I/O location reserved in the AVR instruction set. To ensure backward compatibility with the ATmega103, all I/O locations present in ATmega103 have the same location in ATmega64. Most additional I/O locations are added in an Extended I/O space starting from 0x60 to 0xFF (that is, in the ATmega103 internal RAM space). These location can be reached by using LD/LDS/LDD and ST/STS/STD instructions only, not by using IN and OUT instructions. The relocation of the internal RAM space may still be a problem for ATmega103 users. Also, the increased number of Interrupt Vectors might be a problem if the code uses absolute addresses. To solve these problems, an ATmega103 compatibility mode can be selected by programming the fuse M103C. In this mode, none of the functions in the Extended I/O space are in use, so the internal RAM is located as in ATmega103. Also, the extended Interrupt Vectors are removed.

The ATmega64 is 100% pin compatible with ATmega103, and can replace the ATmega103 on current printed circuit boards. The application notes "Replacing ATmega103 by ATmega128" and "Migration between ATmega64 and ATmega128" describes what the user should be aware of replacing the ATmega103 by an ATmega128 or ATmega64.

## ATmega103 Compatibility Mode

By programming the M103C Fuse, the ATmega64 will be compatible with the ATmega103 regards to RAM, I/O pins and Interrupt Vectors as described above. However, some new features in ATmega64 are not available in this compatibility mode, these features are listed below:

- One USART instead of two, asynchronous mode only. Only the eight least significant bits of the Baud Rate Register is available.
- One 16 bits Timer/Counter with two compare registers instead of two 16 bits Timer/Counters with three compare registers.
- Two-wire serial interface is not supported.
- Port G serves alternate functions only (not a general I/O port).
- Port F serves as digital input only in addition to analog input to the ADC.
- Boot Loader capabilities is not supported.
- It is not possible to adjust the frequency of the internal calibrated RC Oscillator.
- The External Memory Interface can not release any Address pins for general I/O, neither configure different wait states to different External Memory Address sections.
- Only EXTRF and PORF exist in the MCUCSR Register.
- No timed sequence is required for Watchdog Timeout change.
- Only low-level external interrupts can be used on four of the eight External Interrupt sources.
- Port C is output only.
- USART has no FIFO buffer, so Data OverRun comes earlier.
- The user must have set unused I/O bits to 0 in ATmega103 programs.

## Pin Descriptions

**VCC** Digital supply voltage.

**GND** Ground.

**Port A (PA7..PA0)** Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega64 as listed on [page 73](#).

**Port B (PB7..PB0)** Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega64 as listed on [page 74](#).

### Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the ATmega64 as listed on [page 77](#). In ATmega103 compatibility mode, Port C is output only, and the port C pins are **not** tri-stated when a reset condition becomes active.

### Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega64 as listed on [page 78](#).

### Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega64 as listed on [page 81](#).

### Port F (PF7..PF0)

Port F serves as the analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS) and PF4(TCK) will be activated even if a reset occurs.

The TDO pin is tri-stated unless TAP states that shift out data are entered.

Port F also serves the functions of the JTAG interface.

In ATmega103 compatibility mode, Port F is an input port only.

### Port G (PG4..PG0)

Port G is a 5-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features.

In ATmega103 compatibility mode, these pins only serves as strobes signals to the external memory as well as input to the 32 kHz Oscillator, and the pins are initialized to PG0 = 1, PG1 = 1, and PG2 = 0 asynchronously when a reset condition becomes active, even if the clock is not running. PG3 and PG4 are Oscillator pins.

<b><math>\overline{\text{RESET}}</math></b>	Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in <a href="#">Table 19 on page 52</a> . Shorter pulses are not guaranteed to generate a reset.
<b>XTAL1</b>	Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.
<b>XTAL2</b>	Output from the inverting Oscillator amplifier.
<b>AVCC</b>	AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to $V_{CC}$ , even if the ADC is not used. If the ADC is used, it should be connected to $V_{CC}$ through a low-pass filter.
<b>AREF</b>	AREF is the analog reference pin for the A/D Converter.
<b>PEN</b>	This is a programming enable pin for the SPI Serial Programming mode. By holding <u>this</u> pin low during a Power-on Reset, the device will enter the SPI Serial Programming mode. PEN has no function during normal operation.

- Notes:
1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
  2. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O Register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.

## Errata

The revision letter in this section refers to the revision of the ATmega64 device.

### ATmega64, rev. A to C, E

- First Analog Comparator conversion may be delayed
- Interrupts may be lost when writing the timer registers in the asynchronous timer
- Stabilizing time needed when changing XDIV Register
- Stabilizing time needed when changing OSCCAL Register
- IDCODE masks data from TDI input
- Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request

#### 1. First Analog Comparator conversion may be delayed

If the device is powered by a slow rising  $V_{CC}$ , the first Analog Comparator conversion will take longer than expected on some devices.

##### Problem Fix/Workaround

When the device has been powered or reset, disable then enable the Analog Comparator before the first conversion.

#### 2. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

##### Problem Fix/Workaround

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

#### 3. Stabilizing time needed when changing XDIV Register

After increasing the source clock frequency more than 2% with settings in the XDIV register, the device may execute some of the subsequent instructions incorrectly.

##### Problem Fix / Workaround

The NOP instruction will always be executed correctly also right after a frequency change. Thus, the next 8 instructions after the change should be NOP instructions. To ensure this, follow this procedure:

1. Clear the I bit in the SREG Register.
2. Set the new pre-scaling factor in XDIV register.
3. Execute 8 NOP instructions
4. Set the I bit in SREG

This will ensure that all subsequent instructions will execute correctly.

Assembly Code Example:

```

CLI                ; clear global interrupt enable
OUT  XDIV, temp    ; set new prescale value
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
SEI                ; clear global interrupt enable
  
```

#### 4. Stabilizing time needed when changing OSCCAL Register

After increasing the source clock frequency more than 2% with settings in the OSCCAL register, the device may execute some of the subsequent instructions incorrectly.

##### **Problem Fix / Workaround**

The behavior follows errata number 3., and the same Fix / Workaround is applicable on this errata.

#### 5. IDCODE masks data from TDI input

The JTAG instruction IDCODE is not working correctly. Data to succeeding devices are replaced by all-ones during Update-DR.

##### **Problem Fix / Workaround**

- If ATmega64 is the only device in the scan chain, the problem is not visible.
- Select the Device ID Register of the ATmega64 by issuing the IDCODE instruction or by entering the Test-Logic-Reset state of the TAP controller to read out the contents of its Device ID Register and possibly data from succeeding devices of the scan chain. Issue the BYPASS instruction to the ATmega64 while reading the Device ID Registers of preceding devices of the boundary scan chain.
- If the Device IDs of all devices in the boundary scan chain must be captured simultaneously, the ATmega64 must be the first device in the chain.

#### 6. Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request.

Reading EEPROM by using the ST or STS command to set the EERE bit in the EECR register triggers an unexpected EEPROM interrupt request.

##### **Problem Fix / Workaround**

Always use OUT or SBI to set EERE in EECR.

## Changes from Rev. 2490G-03/04 to Rev. 2490H-10/04

1. Removed references to Analog Ground, IC1/IC3 changed to ICP1/ICP3, Input Capture Trigger changed to Input Capture Pin.
2. Updated [“ATmega103 and ATmega64 Compatibility” on page 4](#).
3. Updated [“External Memory Interface” on page 27](#)
4. Updated [“XDIV – XTAL Divide Control Register” to “Clock Sources” on page 38](#).
5. Updated code example in [“WDTCSR – Watchdog Timer Control Register” on page 57](#).
6. Added section [“Unconnected Pins” on page 70](#).
7. Updated [Table 19 on page 52, Table 20 on page 56, Table 95 on page 236, and Table 60 on page 135](#).
8. Updated [Figure 116 on page 239](#).
9. Updated [“Version” on page 255](#).
10. Updated [“DC Characteristics” on page 325](#).
11. Updated [“Typical Characteristics” on page 340](#).

12. Updated features in “Analog to Digital Converter” on page 230 and Table 136 on page 333.

13. Updated “Ordering Information” on page 15.

**Changes from Rev.  
2490F-12/03 to Rev.  
2490G-03/04**

1. Updated “Errata” on page 18.

**Changes from Rev.  
2490E-09/03 to Rev.  
2490F-12/03**

1. Updated “Calibrated Internal RC Oscillator” on page 43.

**Changes from Rev.  
2490D-02/03 to Rev.  
2490E-09/03**

1. Updated note in “XDIV – XTAL Divide Control Register” on page 39.

2. Updated “JTAG Interface and On-chip Debug System” on page 50.

3. Updated “TAP – Test Access Port” on page 248 regarding JTAGEN.

4. Updated description for the JTD bit on page 258.

5. Added a note regarding JTAGEN fuse to Table 118 on page 292.

6. Updated  $R_{PU}$  values in “DC Characteristics” on page 325.

7. Updated “ADC Characteristics” on page 332.

8. Added a proposal for solving problems regarding the JTAG instruction IDCODE in “Errata” on page 18.

**Changes from Rev.  
2490C-09/02 to Rev.  
2490D-02/03**

1. Added reference to Table 124 on page 296 from both SPI Serial Programming and Self Programming to inform about the Flash page size.

2. Added Chip Erase as a first step under “Programming the Flash” on page 322 and “Programming the EEPROM” on page 323.

3. Corrected OCn waveforms in Figure 52 on page 126.

4. Various minor Timer1 corrections.

5. Improved the description in “Phase Correct PWM Mode” on page 101 and on page 153.

6. Various minor TWI corrections.

7. Added note under “Filling the Temporary Buffer (Page Loading)” about writing to the EEPROM during an SPM page load.

8. Removed ADHSM completely.

9. Added note about masking out unused bits when reading the Program Counter in “Stack Pointer” on page 14.

10. Added section **“EEPROM Write During Power-down Sleep Mode”** on page 25.
11. Changed  $V_{HYST}$  value to 120 in **Table 19** on page 52.
12. Added information about conversion time for Differential mode with Auto Triggering on page 234.
13. Added  $t_{WD\_FUSE}$  in **Table 128** on page 308.
14. Updated **“Packaging Information”** on page 16.

## Changes from Rev. 2490B-09/02 to Rev. 2490C-09/02

1. Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.

## Changes from Rev. 2490A-10/01 to Rev. 2490B-09/02

1. Added 64-pad QFN/MLF Package and updated **“Ordering Information”** on page 15.
2. Added the section **“Using all Locations of External Memory Smaller than 64 KB”** on page 35.
3. Added the section **“Default Clock Source”** on page 39.
4. Renamed SPMCR to SPMCSR in entire document.
5. **Added Some Preliminary Test Limits and Characterization Data**  
Removed some of the TBD's and corrected data in the following tables and pages:  
[Table 2 on page 24](#), [Table 7 on page 38](#), [Table 9 on page 41](#), [Table 10 on page 41](#), [Table 12 on page 42](#), [Table 14 on page 43](#), [Table 16 on page 44](#), [Table 19 on page 52](#), [Table 20 on page 56](#), [Table 22 on page 58](#), **“DC Characteristics”** on page 325, [Table 131 on page 327](#), [Table 134 on page 330](#), [Table 136 on page 333](#), and [Table 137 - Table 144](#).
6. **Removed Alternative Algorithm for Leaving JTAG Programming Mode.**  
See **“Leaving Programming Mode”** on page 321.
7. **Improved description on how to do a polarity check of the ADC diff results in “ADC Conversion Result”** on page 242.
8. **Updated Programming Figures:**  
[Figure 138 on page 294](#) and [Figure 147 on page 306](#) are updated to also reflect that AVCC must be connected during Programming mode. [Figure 142 on page 301](#) added to illustrate how to program the fuses.
9. **Added a note regarding usage of the “PROG\_PAGELOAD (0x6)” and “PROG\_PAGEREAD (0x7)” instructions** on page 313.
10. **Updated “TWI – Two-wire Serial Interface”** on page 198.  
More details regarding use of the TWI Power-down operation and using the TWI as master with low TWBRR values are added into the data sheet. Added the note at the end of the **“Bit Rate Generator Unit”** on page 204. Added the description at the end of **“Address Match Unit”** on page 205.
11. **Updated Description of OSCCAL Calibration Byte.**

In the data sheet, it was not explained how to take advantage of the calibration bytes for 2, 4, and 8 MHz Oscillator selections. This is now added in the following sections:

Improved description of “OSCCAL – Oscillator Calibration Register(1)” on page 43 and “Calibration Byte” on page 293.

12. **When using external clock there are some limitations regards to change of frequency. This is descried in “External Clock” on page 44 and Table 131 on page 327.**
13. **Added a sub section regarding OCD-system and power consumption in the section “Minimizing Power Consumption” on page 49.**
14. **Corrected typo (WGM-bit setting) for:**
  - “Fast PWM Mode” on page 99 (Timer/Counter0).
  - “Phase Correct PWM Mode” on page 101 (Timer/Counter0).
  - “Fast PWM Mode” on page 152 (Timer/Counter2).
  - “Phase Correct PWM Mode” on page 153 (Timer/Counter2).
15. **Corrected Table 81 on page 192 (USART).**
16. **Corrected Table 102 on page 262 (Boundary-Scan)**
