CMOS

F²MC-16F MB90210 Series

MB90214/P214A/P214B/W214A/W214B/V210

■ OUTLINE

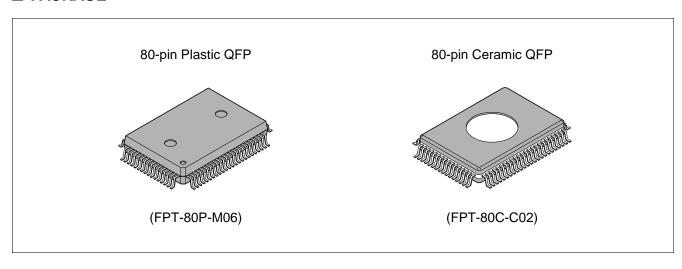

The MB90210 series is a line of 16-bit microcontrollers particularly suitable for system control of video cameras, VTRs, and copiers. The F²MC-16F CPU integrated in this series is based on the F²MC*-16, while providing enhanced instructions for high-level languages and supporting extended addressing modes.

The MB90210 series incorporates a variety of peripheral resources such as a PWC timer with 4 channels, a 10-bit A/D converter with 8 channels, UART serial ports with 3 channels (1 channel for CTS and 1 channel for dual input/output pin switching), 16-bit reload timers with 8 channels, and an 8-bit PPG timer with 1 channel.

MB90P214B/W214B is under development.

*: F2MC stands for FUJITSU Flexible Microcontroller.

■ PACKAGE

■ FEATURES

F²MC-16F CPU

- Minimum execution time: 62.5 ns/16-MHz oscillation (using a duty control system)
- Instruction sets optimized for controllers

Upward object-compatible with the F²MC-16(H)

Various data types (bit, byte, word, and long-word)

Instruction cycle improved to speed up operation

Extended addressing modes: 25 types

High coding efficiency

Access method (bank access with linear pointer)

Enhanced multiplication and division instructions (with signed instructions added)

Higher-precision operation using a 32-bit accumulator

- Extended intelligent I/O service (Automatic transfer function independent of instructions) access area expanded to 64 Kbytes
- Enhanced instruction set applicable to high-level language (C) and multitasking

System stack pointer

Enhanced pointer-indirect instructions

Barrel shift instruction

Stack check function

- Increased execution speed: 8-byte instruction queue
- Powerful interrupt functions: 8 levels and 29 sources

Integrated Peripheral Resources

• ROM : 64 Kbytes (MB90214)

EPROM: 64 Kbytes (MB90W214A/W214B) OTPROM: 64Kbytes (MB90P214A/P214B)

• RAM: 3 Kbytes (MB90214)

4 Kbytes (MB90P214A/P214B/W214A/W214B/V210)

- General-purpose ports: max. 65 channels
- PWC timer with time measurement function: 4 channels
- 10-bit A/D converter: 8 channels
- UART: 3 channels
- Including: 1 channel with CTS function

1 channel with I/O pin switching function

• 16-bit reload timer

Toggled output, external clock, and gate functions: 4 channels External clock and gate functions: 4 channels

- 8-bit PPG timer: 1 channel
- DTP/External-interrupt inputs: 4 channels
- Write-inhibit RAM: 256 bytes (MB90V210: 512 bytes)
- Timebase counter: 18 bits
- · Clock gear function
- Low-power consumption mode

Sleep mode

Stop mode

Hardware standby mode

Product Description

- MB90214 is a mask ROM product.
- MB90P214A/P214B are OTPROM products.
- MB90W214A/W214B are EPROM products. ES only.
- Operating temperature of MB90P214A/W214A is –40°C to +85°C. (However, the AC characteristics is assured in –40°C to +70°C)
- MB90V210 is a evaluation device for the program development. ES only.

■ PIN ASSIGNMENT

■ PIN DESCRIPTION

| Pin no. | Pin name | Circuit type | Function |
|----------------------|----------------------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QFP* | | турс | |
| 64, 65 | X0, X1 | А | Crystal oscillator pins (16 MHz) |
| 62 | RST | Н | External reset request input pin |
| 66 | Vcc | Power supply | Digital circuit power supply pin |
| 11, 34, 63 | Vss | Power supply | Digital circuit grounding level |
| 67 to 74 | P00 to P07 | В | General-purpose I/O ports These ports are available only in the single-chip mode. |
| | D00 to D07 | | I/O pins for the lower eight bits of external data bus These pins are available in an external-bus mode. |
| 75 to 80, 1, 2 | P10 to P15, P16, P17 | В | General-purpose I/O ports These ports are available in the single-chip mode and in an external-bus mode with the 8-bit data bus specified. |
| | D08 to D13, D14, D15 | | I/O pins for the upper eight bits of external data bus These pins are available in an external-bus mode with the 16-bit data bus specified. |
| 3 to 6 | P20 to P23 | Е | General-purpose I/O ports These ports are available only in the single-chip mode. |
| | A00 to A03 | | Output pins for external address buses A00 to A03 These pins are available in an external-bus mode. |
| | TIN0 to TIN3 | | 16-bit reload timer 1 (ch.0 to ch.3) input pins These pins are available when the 16-bit reload timer 1 (ch.0 to ch.3) input specification is "enabled". The data on the pin is read as the 16-bit reload timer 1 (ch.0 to ch.3) input (TIN0 to TIN3). |
| 7 to 10 | P24 to P27 | E | General-purpose I/O ports These ports are available only in the single-chip mode. |
| | A04 to A07 | | Output pins for external address buses A04 to A07 These pins are available in an external-bus mode. |
| | TIN4 to TIN7 | | 16-bit reload timer 2 (ch.4 to ch.7) input pins These pins are available when the 16-bit reload timer 2 (ch.4 to ch.7) input specification is "enabled". The data on the pin is read as the 16-bit reload timer 2 (ch.4 to ch.7) input (TIN4 to TIN7). |
| 12 | P30 | E | General-purpose I/O port This port is available in the single-chip mode or when the middle address control register setting is "port." |
| | A08 | | Output pin for external address bus A08 This pin is available in an external-bus mode and when the middle address control register set to "address." |

^{* :} FPT-80P-M06, FPT-80C-C02

| Pin no. | Pin name | Circuit | Function |
|----------|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QFP* | i iii iiaiiie | type | Tunction |
| 13 | P31 | E | General-purpose I/O port This port is available in the single-chip mode or when the middle address control register setting is "port", with the 8-bit PPG output is disabled. |
| | A09 | | Output pin for external address bus A09 This pin is available in an external-bus mode and when the middle address control register setting is "address." |
| | PPG | | PPG timer output pin This pin is available when the PPG operation mode control register specification is the PPG output pin. |
| 14 to 17 | P32 to P35 | E | General-purpose I/O ports These ports are available in the single-chip mode or when the middle address control register setting is "port", with the 16-bit reload timer 1 (ch.0 to ch.3) output is disabled. |
| | A10 to A13 | | Output pins for external address buses A10 to A13 These pins are available in an external-bus mode and when the middle address control register setting is "address." |
| | TOUT0 to TOUT3 | | 16-bit reload timer 1 (ch.0 to ch.3) output pin These pins are available when the 16-bit reload timer 1 (ch.0 to ch.3) is output operation. |
| 18 | P36 | E | General-purpose I/O port This port is available when the UART (ch.2) clock output is disabled either in the single-chip mode or when the middle address control register setting is "port." |
| | A14 | | Output pin for external address bus A14 This pin is available when the UART (ch.2) clock output is disabled in an external-bus mode and when the middle address control register setting is "address." |
| | SCK3 | | UART (ch.2) clock output pin (SCK3) This pin is available when the UART (ch.2) clock output is enabled. UART (ch.2) external clock input pin (SCK3) This pin is available when the port is in input mode and the UART (ch.2) specification is external clock mode. |
| 19 | P37 | Е | General-purpose I/O port This port is available in the single-chip mode or when the middle address control register setting is "port." |
| | A15 | | Output pin for external address bus A15 This pin is available in an external-bus mode and when middle address control register setting is "address." |
| | SID3 | | UART (ch.2) serial data input pin (SID3) Since this input is used whenever the SID3 is in input operation, the output by any other function must be suspended unless the output is intentionally performed. |

■ I/O CIRCUIT TYPE

(Continued)

Note: The pull-up and pull-down resistors are always connected, regardless of the state.

N-type transistor

: P-type transistor

■ HANDLING DEVICES

1. Preventing Latchup

CMOS ICs may cause latchup when a voltage higher than Vcc or lower than Vss is applied to input or output pins, or when a voltage exceeding the rating is applied between Vcc and Vss.

If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Use meticulous care not to let any voltage exceed the maximum rating.

Also, take care to prevent the analog power supply (AVcc and AVRH) and analog input from exceeding the digital power supply (Vcc) when the analog system power supply is turned on and off.

2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

3. Treatment of Pins when A/D is not Used

Connect to be AVcc = AVRH = Vcc and AVss = AVRL = Vss even if the A/D converter is not in use.

4. Precautions when Using an External Clock

To reset the internal circuit properly by the Low-level input to the \overline{RST} pin, the "L" level input to the \overline{RST} pin must be maintained for at least five machine cycles. Pay attention to it if the chip uses external clock input.

5. Vcc and Vss Pins

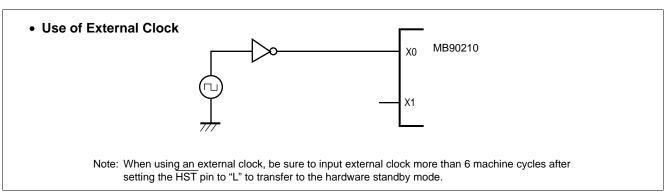

Apply equal potential to the Vcc and Vss pins.

6. Supply Voltage Variation

The operation assurance range for the $V_{\rm CC}$ supply voltage is as given in the ratings. However, sudden changes in the supply voltage can cause misoperation, even if the voltage remains within the rated range. Therefore, it is important to supply a stable voltage to the IC. The recommended power supply control guidelines are that the commercial frequency (50 to 60 Hz) ripple variation (P-P value) on $V_{\rm CC}$ should be less than 10% of the standard $V_{\rm CC}$ value and that the transient rate of change during sudden changes, such as during power supply switching, should be less than 0.1 V/ms.

7. Notes on Using an External Clock

When using an external clock, drive the X0 pin as illustrated below. When an external clock is used, oscillation stabilization time is required even for power-on reset and wake-up from stop mode.

8. Power-on Sequence for A/D Converter Power Supplies and Analog Inputs

Be sure to turn on the digital power supply (Vcc) before applying voltage to the A/D converter power supplies (AVcc, AVRH, and AVRL) and analog inputs (AN0 to AN7).

When turning power supplies off, turn off the A/D converter power supplies (AVcc, AVRH, and AVRL) and analog inputs (AN0 to AN7) first, then the digital power supply (Vcc).

When turning AVRH on or off, be careful not to let it exceed AVcc.

■ PROGRAMMING FOR MB90P214A/P214B/W214A/W214B

In EPROM mode, the MB90P214A/P214B/W214A/W214B functions equivalent to the MBM27C1000. This allows the EPROM to be programmed with a general-purpose EPROM programmer by using the dedicated socket adapter (do not use the electronic signature mode).

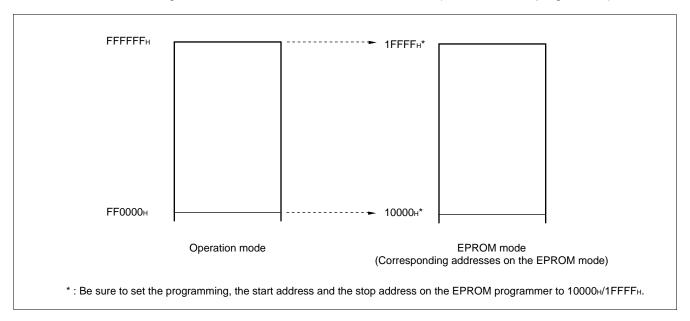

1. Program Mode

When shipped from Fujitsu, and after each erasure, all bits (64 K \times 8 bits) in the MB90P214A/P214B/W214A/W214B are in the "1" state. Data is written to the ROM by selectively programming "0's" into the desired bit locations. Bits cannot be set to "1" electrically.

2. Programming Procedure

- (1) Set the EPROM programmer to MBM27C1000.
- (2) Load program data into the EPROM programmer at 10000H to 1FFFFH.

Note that ROM addresses FF0000H to FFFFFH in the operation mode in the MB90P214A/P214B/W214A/W214B series assign to 10000H to 1FFFFH in the EPROM mode (on the EPROM programmer).

- (3) Mount the MB90P214A/P214B/W214A/W214B on the adapter socket, then fit the adapter socket onto the EPROM programmer. When mounting the device and the adapter socket, pay attention to their mounting orientations.
- (4) Start programming the program data to the device.
- (5) If programming has not successfully resulted, connect a capacitor of approx. 0.1 μF between Vcc and GND, between VPP and GND.
- (6) Since the MB90P214A and MB90W214A have CMOS-level input, programming to them may be impossible depending on the output level of the general-purpose programmer. In that case, connect a pull-up resistor to the adapter socket side.

Note: The mask ROM products (MB90214) does not support EPROM mode. Data cannot, therefore, be read by the EPROM programmer.

3. EPROM Programmer Socket Adapter and Recommended Programmer Manufacturer

FAX: (81)-3-5396-9106

Advantest Corp.: TEL: Except JAPAN (81)-3-3930-4111

4. Erase Procedure

Data written in the MB90W214A/W214B are erased (from "0" to "1") by exposing the chip to ultraviolet rays with a wavelength of 2,537 Å through the translucent cover.

Recommended irradiation dosage for exposure is 10 Wsec/cm². This amount is reached in 15 to 20 minutes with a commercial ultraviolet lamp positioned 2 to 3 cm above the package (when the package surface illuminance is $1200 \, \mu \text{W/cm}^2$).

If the ultraviolet lamp has a filter, remove the filter before exposure. Attaching a mirrored plate to the lamp increases the illuminance by a factor of 1.4 to 1.8, thus shortening the required erasure time. If the translucent part of the package is stained with oil or adhesive, transmission of ultraviolet rays is degraded, resulting in a longer erasure time. In that case, clean the translucent part using alcohol (or other solvent not affecting the package).

The above recommended dosage is a value which takes the guard band into consideration and is a multiple of the time in which all bits can be evaluated to have been erased. Observe the recommended dosage for erasure; the purpose of the guard band is to ensure erasure in all temperature and supply voltage ranges. In addition, check the life span of the lamp and control the illuminance appropriately.

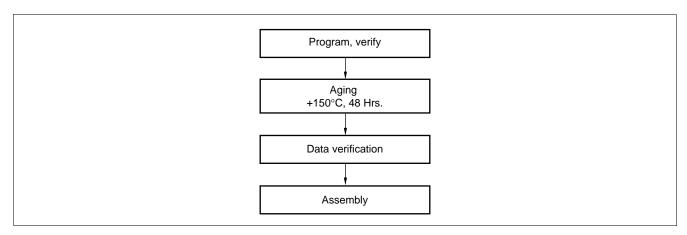

Data in the MB90W214A/W214B are erased by exposure to light with a wavelength of 4000 Å or less.

Data in the device is also erased even by exposure to fluorescent lamp light or sunlight although the exposure results in a much lower erasure rate than exposure to 2537 Å ultraviolet rays. Note that exposure to such lights for an extended period will therefore affect system reliability. If the chip is used where it is exposed to any light with a wavelength of 4000 Å or less, cover the translucent part, for example, with a protective seal to prevent the chip from being exposed to the light.

Exposure to light with a wavelength of 4,000 to 5,000 Å or more will not erase data in the device. If the light applied to the chip has a very high illuminance, however, the device may cause malfunction in the circuit for reasons of general semiconductor characteristics. Although the circuit will recover normal operation when exposure is stopped, the device requires proper countermeasures for use in a place exposed continuously to such light even though the wavelength is 4,000 Å or more.

5. Recommended Screening Conditions

High temperature aging is recommended as the pre-assembly screening procedure.

6. Programming Yeild

MB90P214A/P214B cannot be write-tested for all bits due to their nature. Therefore the write yield cannot always be guaranteed to be 100%.

7. Pin Assignment in EPROM Mode

(1) Pins compatible with MBM27C1000

- #: The initial value of this bit varies with the operation mode.
- *1: Access inhibited
- *2: The only area available for the external access below address 0000FFH is this area. Accesses to these addresses are handled as accesses to an external I/O area.
- *3: When the external bus is enabled, do not access any register not serving as a general-purpose port in the areas from address 000000H to 000005H and from 000010H to 000015H.
- *4: Writing to bit 15 is possible. Writing to other bits is used as a test function.

■ PERIPHERAL RESOURCES

1. Parallel Ports

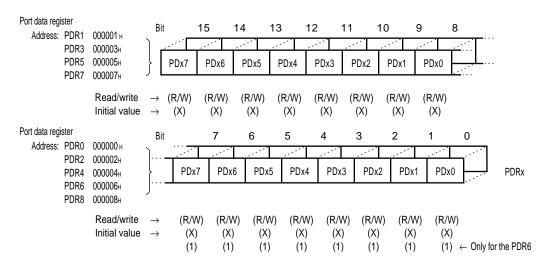

The MB90210 series has 57 I/O pins and 8 open-drain I/O pins.

Ports 0 to 5, 7, and 8 are I/O ports. Each of these ports serves as an input port when the data direction register value is 0 and as an output port when the value is 1.

Port 6 is an open-drain port, which may be used as a port when the analog input enable register value is 0.

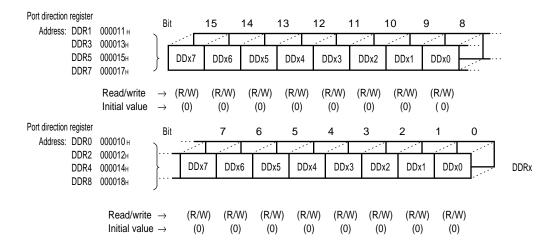

(1) Register Configuration

• Port data registers 0 to 8 (PDR0 to PDR8)

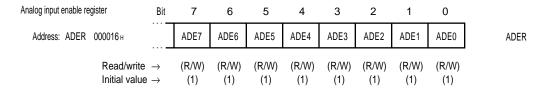

Note: No register bit is included in bits 7 and 6 of port 7 or bits 7 to 3 of port 8.

Port direction registers 0 to 5, 7, and 8 (DDR0 to DDR5, DDR7, and DDR8)

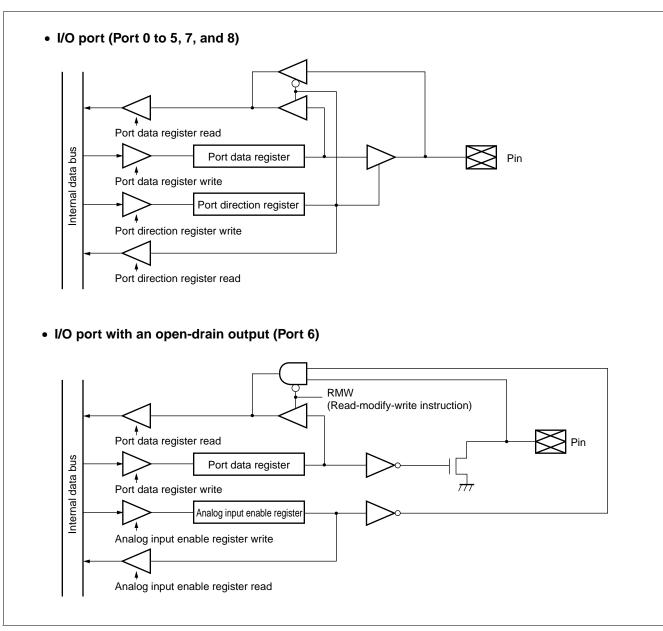

Note: No register bit is included in bits 7 and 6 of port 7 or bits 7 to 3 of port 8. Port 6 has no DDR.

• Analog input enable register (ADER)

(2) Block Diagram

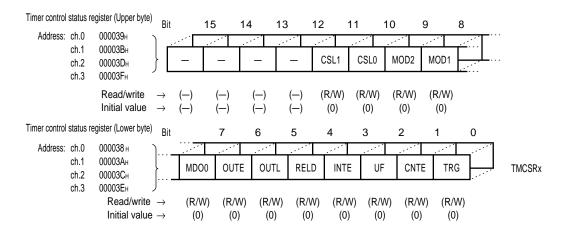

2. 16-bit Reload Timer 1 (with Event Count Function)

The 16-bit reload timer 1 consists of a 16-bit down counter, a 16-bit reload register, an input pin (TIN), an output pin (TOUT), and a control register. The input clock can be selected from among three internal clocks and one external clock. At the output pin (TOUT), the pulses in the toggled output waveform are output in the reload mode; the rectangular pulses indicating that the timer is counting are in the single-shot mode. The input pin (TIN) can be used for event input in the event count mode, and for trigger input or gate input in the internal clock mode.

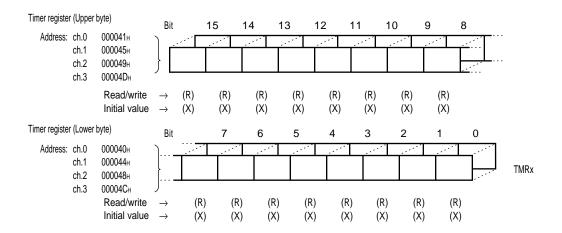

MB90210 series contains four channels for this timer.

(1) Register Configuration

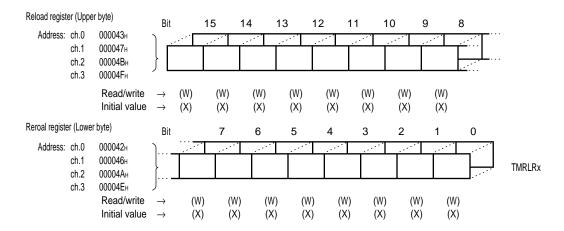

• Timer control status register (TMCSR)

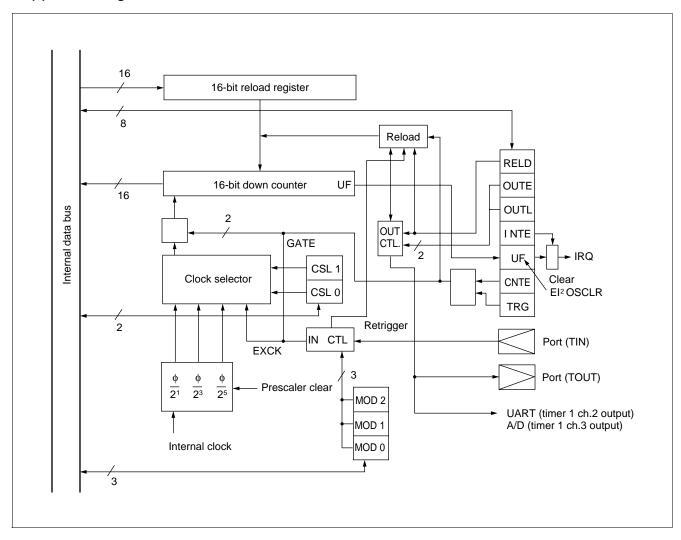

Timer register (TMR)

• Reload register (TMRLR)

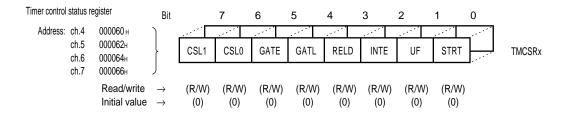

3. 16-bit Reload Timer 2 (with Gate Mode)

The 16-bit reload timer 2 consists of a 16-bit down counter, a 16-bit reload register, an input pin (TIN), and an 8-bit control register. The input clock can be selected from among four internal clocks.

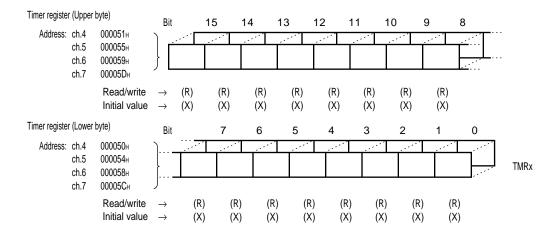

The MB90210 series contains four channels for this timer.

(1) Register Configuration

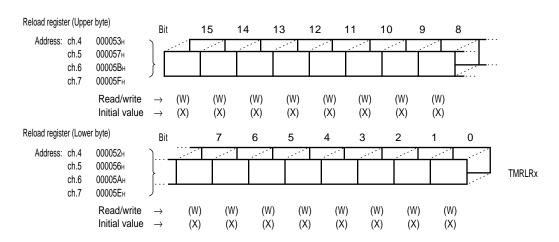

• Timer control status register (TMCSR)

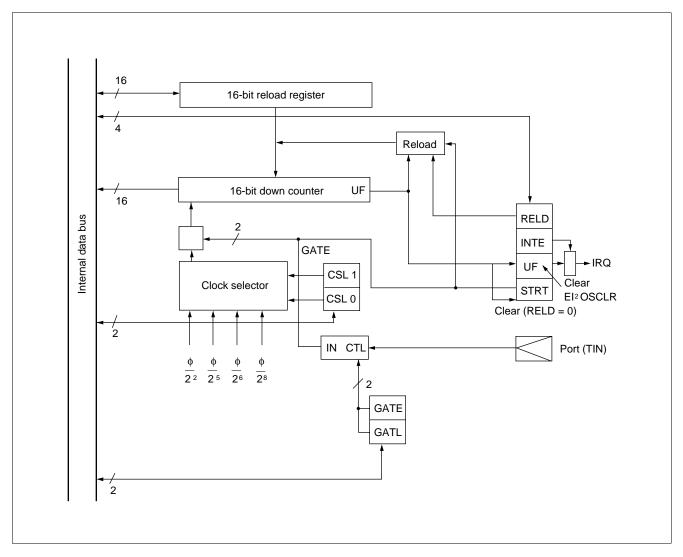

• Timer register (TMR)

• Reload register (TMRLR)

4. UART

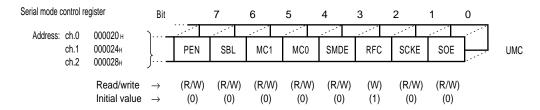

The UART is a serial I/O port for synchronous or asynchronous communication with external resources. It has the following features:

- Full duplex double buffer
- Data transfer synchronous or asynchronous with clock pulses
- Multiprocessor mode support (Mode 2)
- Built-in dedicated baud-rate generator (Nine types)
- Arbitrary baud-rate setting from external clock input or internal timer (Use the 16-bit reroad timer 1 channel 2 for internal timer.)
- Variable data length (7 to 9 bits (without parity bit); 6 to 8 bits (with parity bit))
- Variable data length (7 to 9 bit no parity, 6 to 8 bit with parity)
- Error detection function (Framing, overrun, parity)
- Interrupt function (Two sources for transmission and reception)
- · Transfer in NRZ format

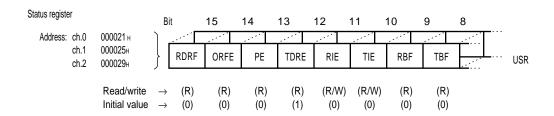

The MB90210 series contains three channels for the UART. UART channel 0 has the CTS function. UART channel 2 provides dual I/O pin switching.

(1) Register Configuration

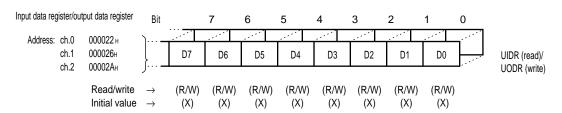

• Serial mode control register (UMC)

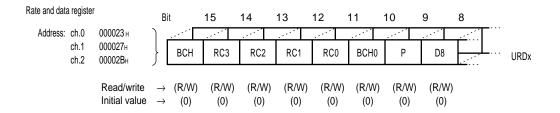

• Status register (USR)

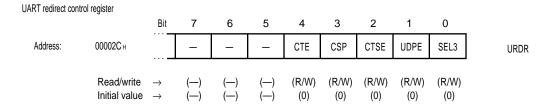

Input data register (UIDR)/output data register (UODR)

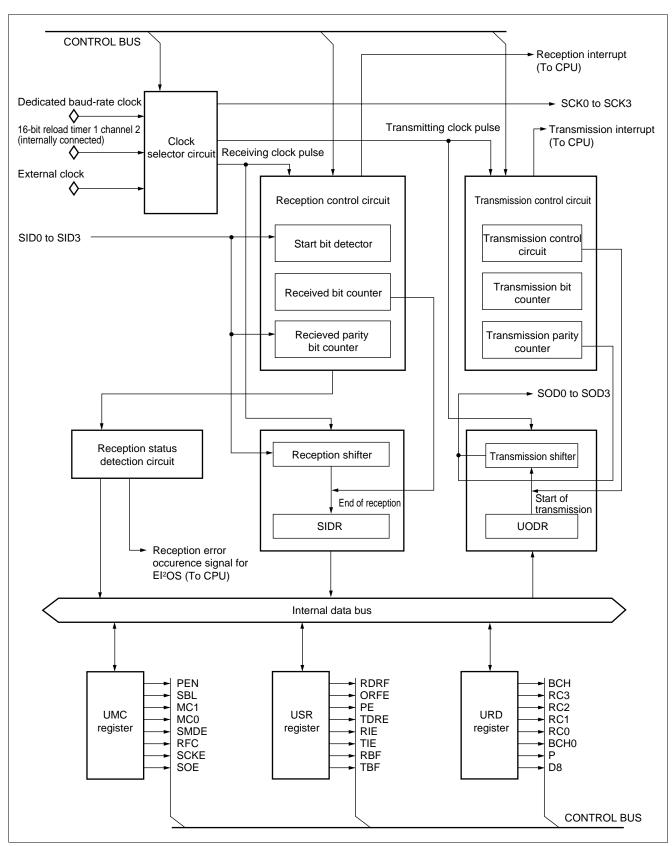

• Rate and data register (URD)

• UART redirect control register (URDR)

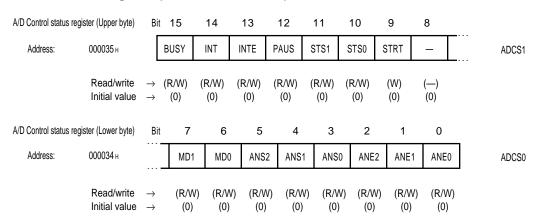

5. 10-bit A/D Converter

The 10-bit A/D converter converts the analog input voltage to a digital value. It has the following features:

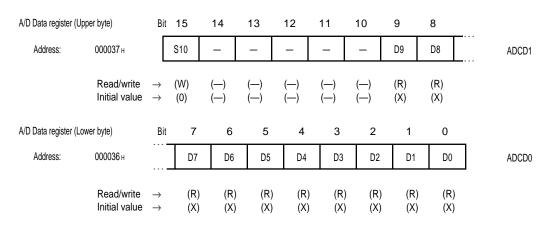

- Conversion time: min.6.125 μs per channel (at 16-MHz machine clock)
- RC-type successive approximation with built-in sample-and-hold circuit
- 10-bit or 8-bit resolution
- Eight analog input channels programmable for selection
 - Single conversion mode: Selects and converts one channel.
 - Scan conversion mode: Converts multiple consecutive channels (up to eight channels programmable).
 - Consecutive conversion mode: Converts a specified channel repeatedly.
 - Stop conversion mode: Converts one channel and suspends its own operation until the next activation (allowing synchronized conversion start).
- On completion of A/D conversion, the converter can generate an interrupt request to the CPU. This interrupt generation can activate the El²OS to transfer the A/D conversion result to memory, making the converter suitable for continuous operation.
- Conversion can be activated by software, external trigger (falling edge), and/or timer (rising edge) as selected. Use the 16-bit reroad timer 1 channel 3 for the timer.

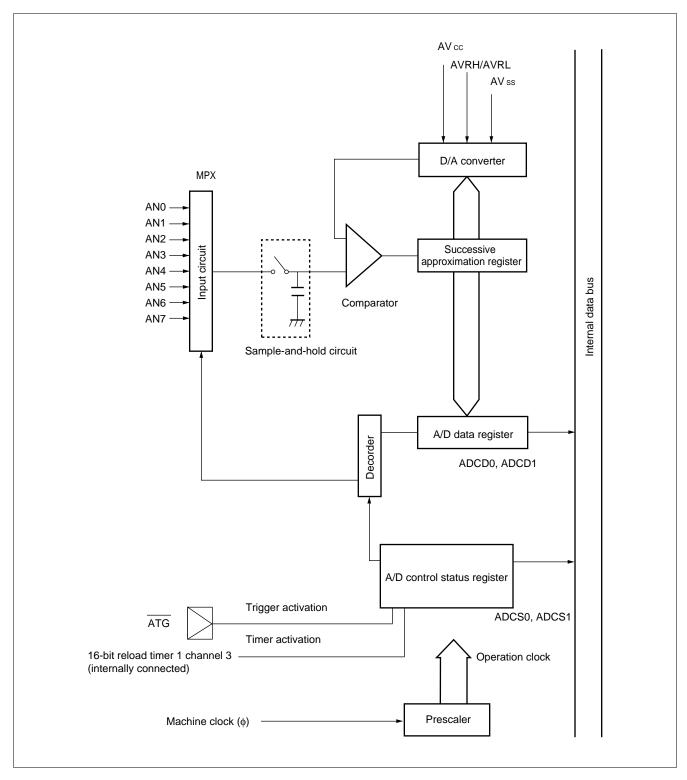

(1) Register Configuration

A/D Control status register (ADCS1 and ADCS0)

• A/D Data registers (ADCD1 and ADCD0)

6. PWC(Pulse Width Count) Timer

The PWC (pulse width count) timer is a 16-bit multifunction up-count timer with an input-signal pulse-width count function and a reload timer function. The hardware configuration of this module is a 16-bit up-count timer, an input pulse divider with divide ratio control register, four count input pins, and a 16-bit control register. Using these components, the PWC timer provides the following features:

· Timer functions: An interrupt request can be generated at set time intervals.

Pulse signals synchronized with the timer cycle can be output.

The reference internal clock can be selected from among three internal clocks.

 Pulse-width count functions: The time between arbitrary pulse input events can be counted.

The reference internal clock can be selected from among three internal clocks.

Various count modes:

"H" pulse width (\uparrow to \downarrow) /"L" pulse width (\uparrow to \downarrow) Rising-edge cycle (\uparrow to \uparrow) /Falling-edge cycle (\downarrow to \downarrow)

Count between edges (\uparrow or \downarrow to \downarrow or \uparrow)

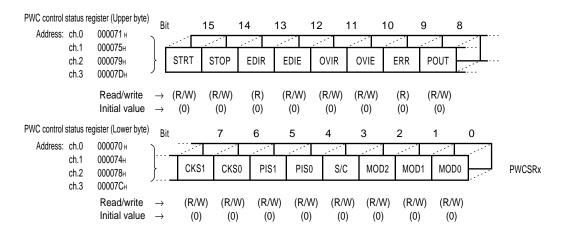

Cycle count can be performed by 22n division (n = 1, 2, 3, 4) of the input pulse, with an 8 bit input divider.

An interrupt request can be generated once counting has been performed. The number of times counting is to be performed (once or subsequently) can be selected.

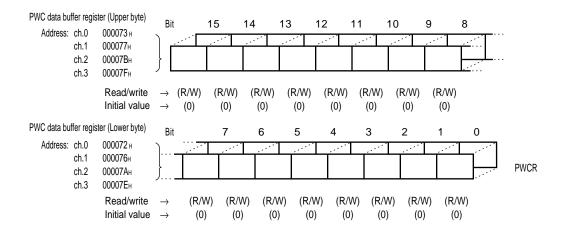

The MB90210 series contains four channels for the PWC timer.

(1) Register Configuration

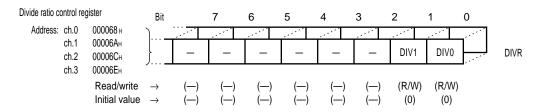

• PWC control status register (PWCSR)

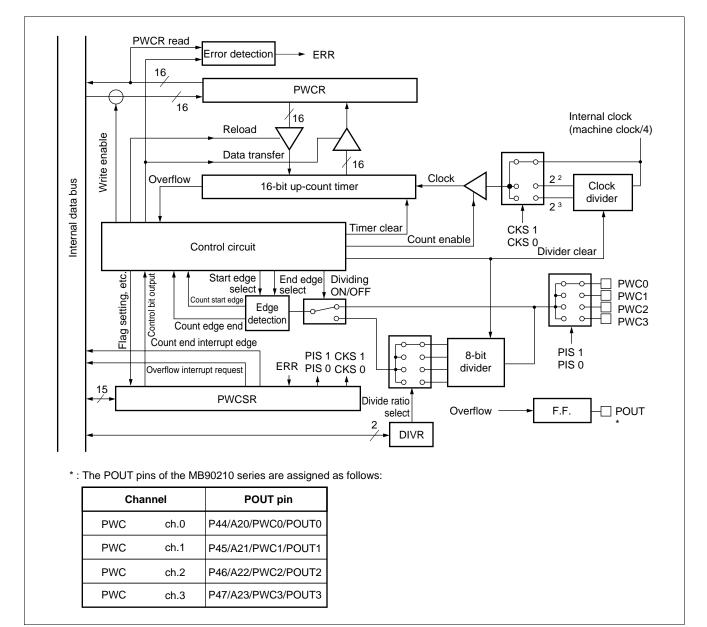

• PWC data buffer register (PWCR)

• PWC divide ratio control register (DIVR)

7. 8-bit PPG Timer

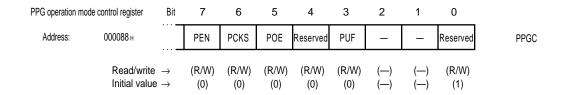

This block is an 8-bit reload timer module for PPG output by controlling pulse output according to the timer operation.

The hardware configuration of this block is an 8-bit down counter, two 8-bit reload registers, an 8-bit control register, and an external pulse output pin. Using these components, the module provides the following features:

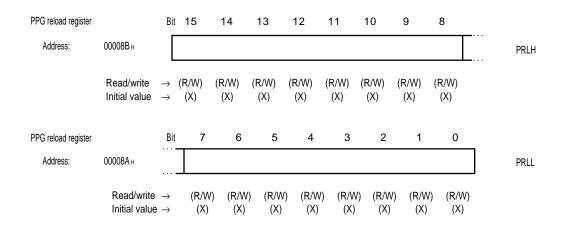

PPG output operation: The module outputs pulse waves of any period and duty factor. It can also be used as a D/A converter using an external circuit.

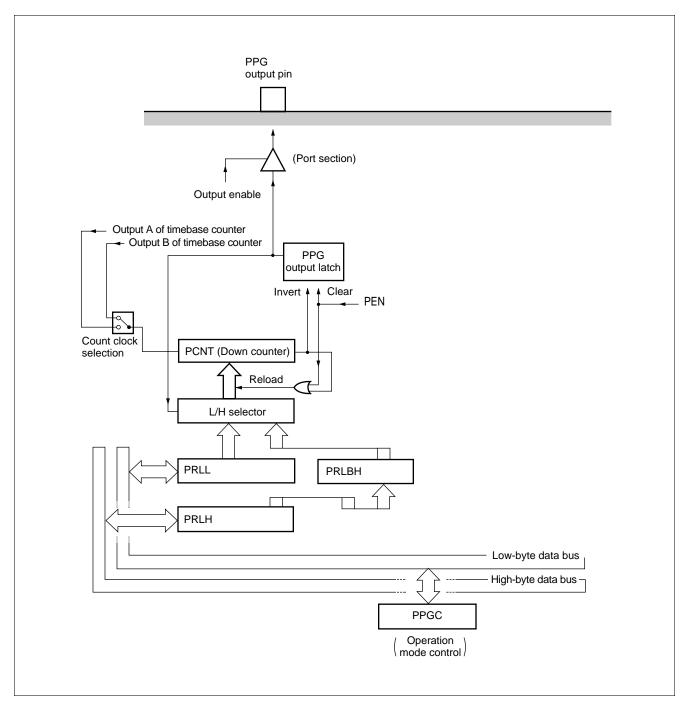

(1) Register Configuration

PPG operation mode control register (PPGC)

• PPG reload registers (PRLL and RRLH)

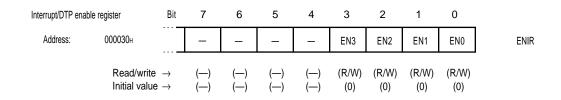

8. DTP/External Interrupt

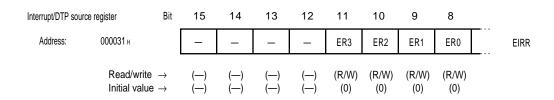

The data transfer peripheral (DTP) is located between external peripherals and the F²MC-16F CPU. It receives a DMA request or an interrupt request generated by the external peripherals and reports it to the F²MC-16F CPU to activate the extended intelligent I/O service or interrupt handler. The user can select two request levels of "H" and "L" for extended intelligent I/O service or, and four request levels of "H," "L," rising edge and falling edge for external interrupt requests.

(1) Register Configuration

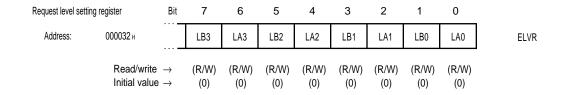

• Interrupt/DTP enable register (ENIR)

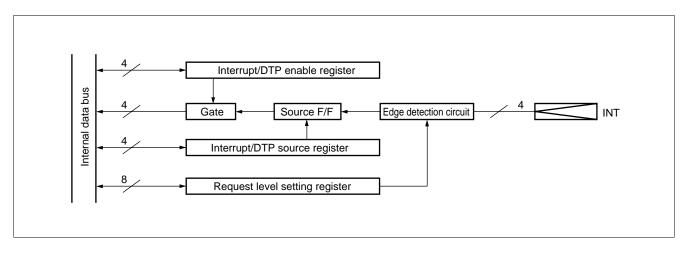

• Interrupt/DTP source register (EIRR)

• Request level setting register (ELVR)

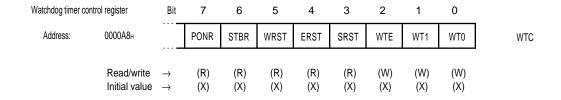

9. Watchdog Timer and Timebase Timer

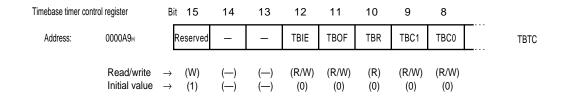

The watchdog timer consists of a 2-bit watchdog counter using carry signals from an 18-bit timebase timer as the clock source, a control register, and a watchdog reset control section. The timebase timer consists of an 18-bit timer and an interval interrupt control circuit.

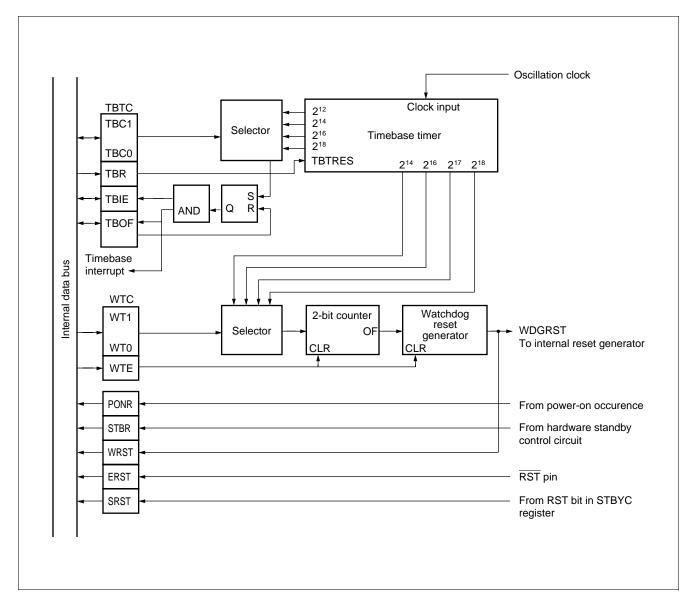

(1) Register Configuration

Watchdog timer control register (WTC)

• Timebase timer control register (TBTC)

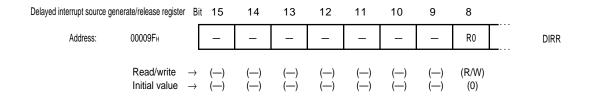

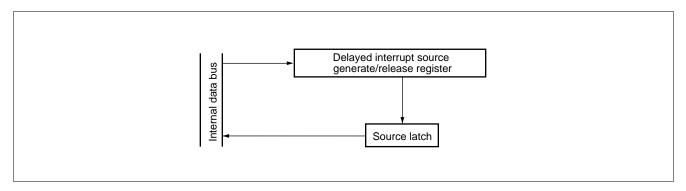

10. Delayed Interrupt Generation Module

The delayed interrupt generation module is used to generate an interrupt for task switching. Using this module allows an interrupt request to the F²MC-16F CPU to generate or cancel by software.

(1) Register Configuration

• Delayed interrupt source generate/release register (DIRR)

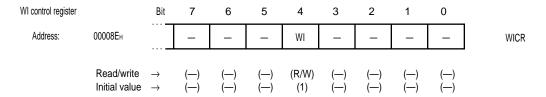

11. Write-inhibit RAM

The write-inhibit RAM is write-protectable with the \overline{WI} pin input. Maintaining the "L" level input to the \overline{WI} pin prevents a certain area of RAM from being written. The \overline{WI} pin has a 4-machine-cycle filter.

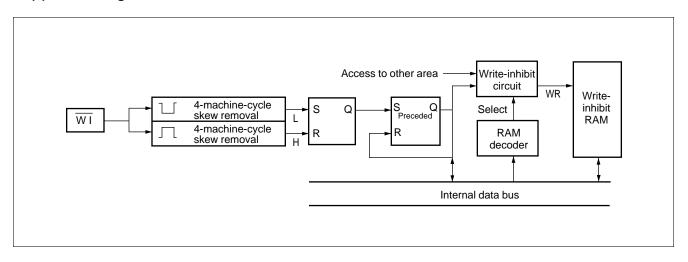

(1) Register Configuration

• WI control register (WICR)

(2) Write-inhibit RAM Area

Write-inhibit RAM area 001100н to 0011FFн (МВ90214/Р214А/Р214В/W214A/W214B) 001100н to 0012FFн (МВ90V210)

12. Low-power Consumption Modes, Oscillation Stabilization Delay Time, and Gear Function

The MB90210 series has three low-power consumption modes: the sleep mode, the stop mode, the hardware standby mode, and gear function.

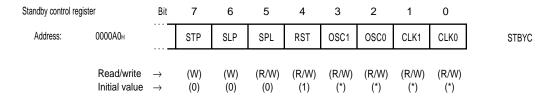

Sleep mode is used to suspend only the CPU operation clock; the other components remain in operation. Stop mode and hardware standby mode stop oscillation, minimizing the power consumption while holding data.

The clock gear function divides the external clock frequency, which is used usually as it is, to provide a lower machine clock frequency. This function can therefore lower the overall operation speed without changing the oscillation frequency. The function can select the machine clock as a division of the frequency of crystal oscillation or external clock input by 1, 2, 4, or 16.

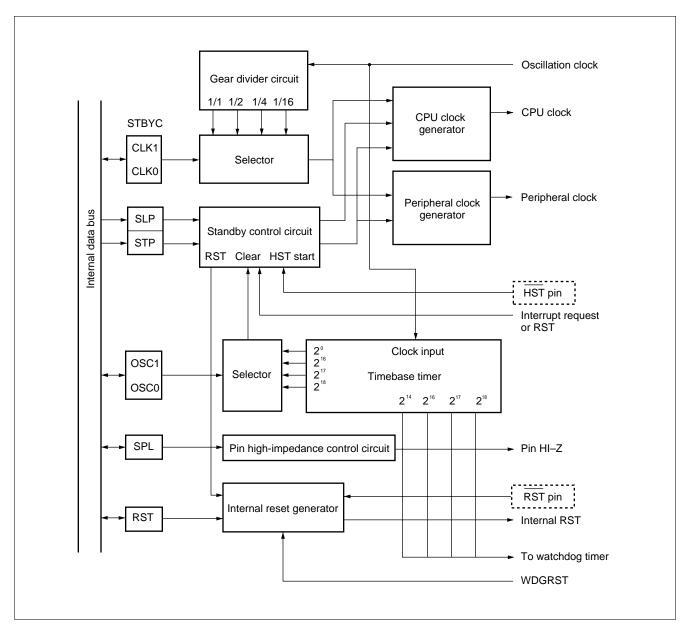

The OSC1 and OSC0 bits can be used to set the oscillation stabilization delay time for wake-up from stop mode or hardware standby mode.

(1) Register Configuration

Standby control register (STBYC)

Note: The initial value(*) of bit0 to bit3 is changed by reset source.

^{*:} Excluding the temperature rise due to the heat produced.

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

• Sample Application of Piezoelectric Resonator (FAR Series)

*1: Fujitsu Acoustic Resonator

| FAR part number (built-in capacitor type) | Frequency | Initial deviation of FAR frequency (T _A = +25°C) | Temperature characteristics of FAR frequency (T _A = -20°C to +60°C) | Load capacitance*2 |
|-------------------------------------------|-----------|-------------------------------------------------------------|--------------------------------------------------------------------------------|-----------------------|
| FAR-C4C F-1 6000-□02 | 16.00 | ±0.5% | ±0.5% | - Built-in |
| FAR-C4C F-1 6000-□12 | 10.00 | ±0.5% | ±0.5% | Built-III |

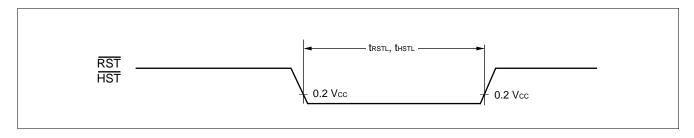

Inquiry: FUJITSU LIMITED

(4) Reset and Hardware Standby Input Standards

Single-chip mode MB90214/P214B/W214B : $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +105^{\circ}\text{C})$ MB90P214A/W214A : $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +85^{\circ}\text{C})$ External bus mode : $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

Value Pin **Parameter Symbol** Condition Unit Remarks name Min. Typ. Max. RST Reset input time 5 tcyc ns Hardware standby input time thest **HST** 5 tcyc ns

^{*:} The machine cycle (tcyc) at hardware standby input is set to 1/16 divided oscillation.

(5) Power on Supply Specifications (Power-on Reset)

Single-chip mode MB90214/P214B/W214B : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40^{\circ}\text{C to } +105^{\circ}\text{C}$) MB90P214A/W214A : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40^{\circ}\text{C to } +85^{\circ}\text{C}$)

External bus mode

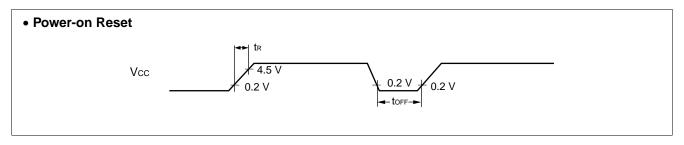

: $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

| Parameter | Symbol | Pin name | Condition | | Value | Unit | Remarks | |
|---------------------------|------------|-------------|-----------|------|-------|------|---------|-------------|
| | Syllibol | | | Min. | Тур. | Max. | Ollit | iveillai ka |
| Power supply rising time | t R | Vcc | _ | _ | _ | 30 | ms | * |
| Power supply cut-off time | toff | Vcc | _ | 1 | | | ms | |

^{* :} Before the power rising, Vcc must be less than +0.2 V.

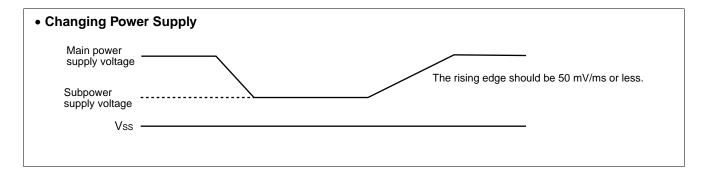

Notes: • The above specifications are for the power-on reset.

- Always apply power-on reset using these specifications, regardless of whether or not the power-on reset is needed.
- There are some internal registers (such as STBYC) which are only initialized by the power-on reset.

Note: Caution on switching power supply

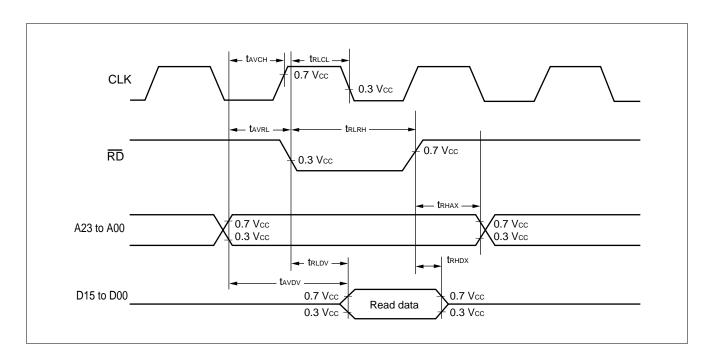

Abrupt change of supply voltage may initiate power-on reset, even if the above requirements are not met. It is, therefore, recommended to power up gradually during the instantaneous change of power supply as shown in the figure below.

(6) Bus Read Timing

 $(Vcc = +4.5 \text{ to } +5.5 \text{ , } Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

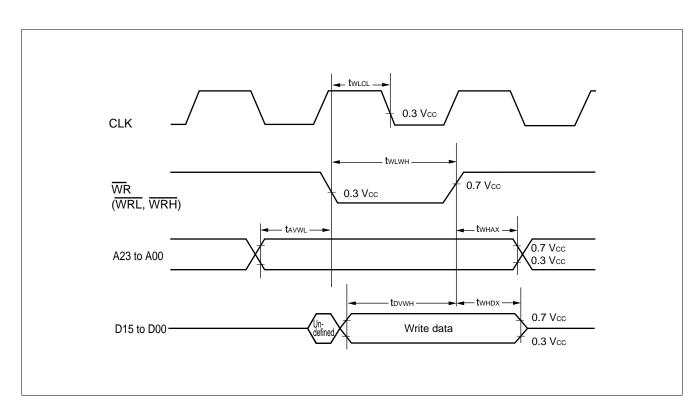

| Parameter | Symbol | Pin | Condition | Va | lue | Unit | Remarks |
|-----------------------------------------------------------|---------------|-------------------|-----------------------------|-------------|---------------|-------|---------|
| Parameter | Symbol | name | Condition | Min. | Max. | Oilit | Remarks |
| Valid address $\rightarrow \overline{RD} \downarrow time$ | t avrl | A23 to A00 | | tcvc/2 - 20 | _ | ns | |
| RD pulse width | t rlrh | RD | | tcyc - 25 | _ | ns | |
| $\overline{RD} \downarrow \to valid$ data input | trldv | | | _ | tcyc - 30 | ns | |
| $\overline{RD} \uparrow \to data \; hold \; time$ | t RHDX | D15 to D00 | Load condition: 80 pF | 0 | _ | ns | |
| Valid address→ valid data input | tavdv | | | _ | 3 tcyc/2 - 40 | ns | |
| $\overline{RD} \uparrow \to address\ valid\ time$ | t RHAX | A23 to A00 | | tcyc/2 - 20 | _ | ns | |
| Valid address → CLK ↑ time | tavch | A23 to A00 CLK | | tcyc/2 - 25 | _ | ns | |
| $\overline{RD} \downarrow \to CLK \downarrow time$ | t rlcl | RD, CLK | | tcyc/2 - 25 | _ | ns | |

(7) Bus Write Timing

 $(Vcc = +4.5 \text{ to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

| Parameter | Symbol | Pin name | Condition | Val | ue | Unit | Remarks |
|---------------------------------------------------------------------------------------------|--------|---------------|-----------------------------|-------------|------|-------|---------|
| rarameter | Symbol | Fili lialile | Condition | Min. | Max. | Oilit | Remarks |
| $Valid\;address\to\overline{WR}\;\!\downarrowtime$ | tavwl | A23 to A00 | | tcyc/2 - 20 | _ | ns | |
| WR ↓ pulse width | twlwh | WRL, WRH | | tcyc - 25 | _ | ns | |
| Valid data output \rightarrow $\overline{\text{WR}}$ \uparrow time | tovwh | D15 to D00 | Load condition: 80 pF | tcyc - 40 | _ | ns | |
| $\overline{\mathrm{WR}} \uparrow \rightarrow \mathrm{data} \ \mathrm{hold} \ \mathrm{time}$ | twhox | | | tcyc/2 - 20 | _ | ns | |
| $\overline{ m WR} \uparrow ightarrow$ address valid time | twhax | A23 to A00 | | tcyc/2 - 20 | _ | ns | |
| $\overline{WR} \downarrow \to CLK \downarrow time$ | twlch | WRL, WRH, CLK | | tcyc/2 - 25 | _ | ns | |

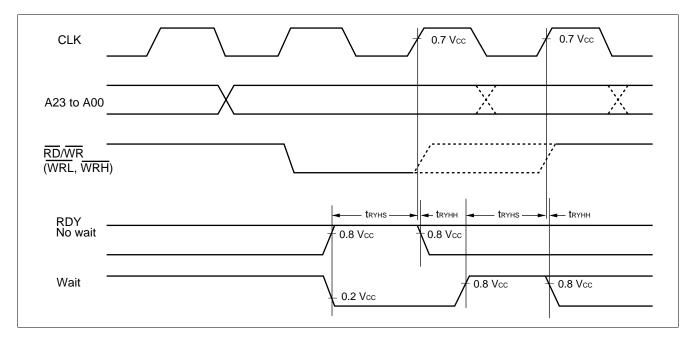

(8) Ready Signal Input Timing

 $(Vcc = +4.5 \text{ to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

| Parameter | Symbol Pin name | | Condition | Va | lue | Unit | Remarks |
|----------------|-----------------|-------------|-----------------|------|------|------|------------|
| | Symbol | Fill Hallie | Condition | Min. | Max. | Onit | Neillai No |
| RDY setup time | tryhs | RDY | Load condition: | 40 | _ | ns | |
| RDY hold time | tпунн | INDI | 80 pF | 0 | _ | ns | |

Note: Use the auto-ready function if the RDY setup time is insufficient.

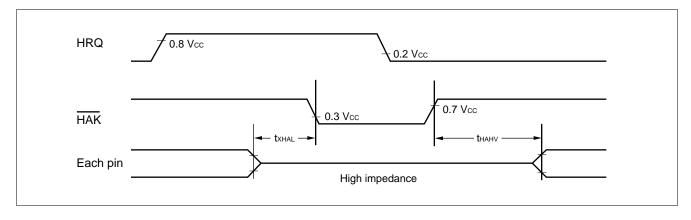

(9) Hold Timing

 $(Vcc = +4.5 \text{ to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

| Parameter | | Pin | Condition | Va | lue | Unit | Remarks |
|-------------------------------------------------------------------------|---------------|------|--------------------------|------|-------|------|---------|
| | | name | Condition | Min. | Max. | | |
| Pin floating $\rightarrow \overline{\text{HAK}} \downarrow \text{time}$ | t xhal | HAK | Load condition: 80 pF | 30 | tcyc | ns | |
| $\overline{HAK} \uparrow \to pin \ valid \ time$ | t hahv | HAR | | tcyc | 2tcyc | ns | |

Note: It takes at least one cycle for \overline{HAK} to vary after HRQ is fetched.

(10) UART Timing

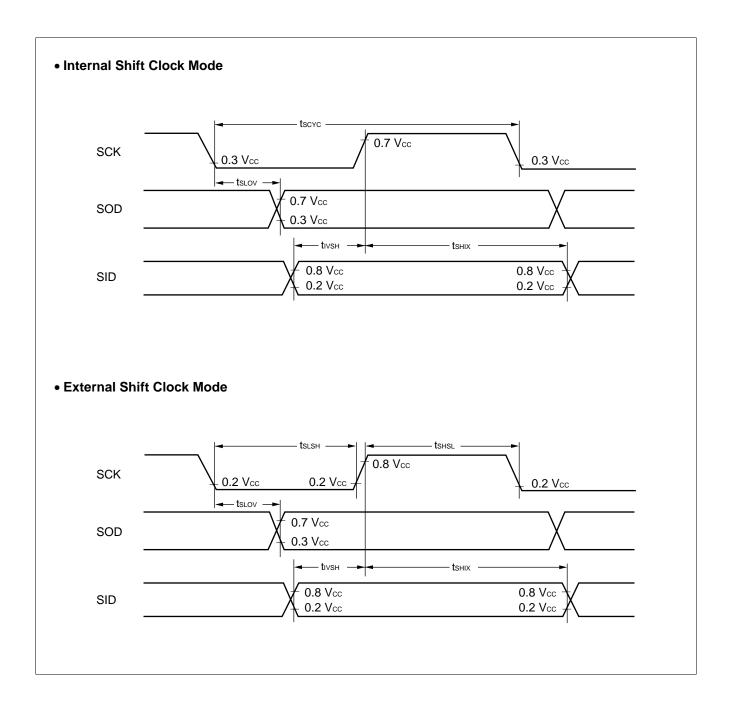

Single-chip mode MB90214/P214B/W214B : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, T_A = -40°C to +105°C) MB90P214A/W214A : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, T_A = -40°C to +85°C)

External bus mode $(V_{CC} = +4.5 \text{ V to } +5.5 \text{ V}, V_{SS} = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

| Danamatan | Symbol | Pin name | Condition | Va | Value | | Damania | |
|-------------------------------------------------------------------------------|---------------|-------------|--------------------------|--------|-------|------|--------------------------|--|
| Parameter | | | Condition | Min. | Max. | Unit | Remarks | |
| Serial clock cycle time | tscyc | | | 8 tcyc | _ | ns | | |
| $\begin{array}{c} SCLK \downarrow \to SOUT \\ delay \ time \end{array}$ | tsLov | | | -80 | 80 | ns | Internal shift | |
| Valid SIN \rightarrow SCLK ↑ | tivsh | | | 100 | _ | ns | clock mode output pin | |
| $\begin{array}{c} SCLK \uparrow \to Valid \; SIN \\ hold \; time \end{array}$ | tsнıx | | Load condition: 80 pF | 60 | _ | ns | | |
| Serial clock "H" pulse width | tshsl | _ | | 4 tcyc | _ | ns | | |
| Serial clock "L" pulse width | tslsh | | O P | 4 tcyc | _ | ns | External shift | |
| $\begin{array}{c} SCLK \downarrow \to SOUT \\ delay \ time \end{array}$ | tsLov | | | _ | 150 | ns | clock mode output pin | |
| Valid SIN \rightarrow SCLK ↑ | tıvsh | | | 60 | _ | ns | | |
| $\begin{array}{c} SCLK \uparrow \to Valid \; SIN \\ hold \; time \end{array}$ | t shix | | | 60 | _ | ns | | |

Notes: • These AC characteristics assume the CLK synchronous mode.

• teye is the machine cycle (unit: ns).

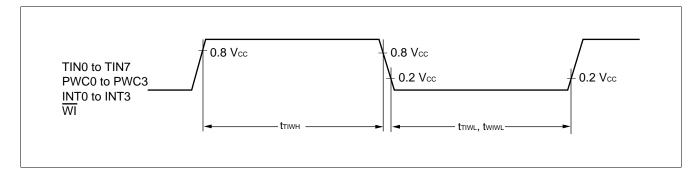

(11) Resource Input Timing

Single-chip mode MB90214/P214B/W214B : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40^{\circ}\text{C}$ to $+105^{\circ}\text{C}$) MB90P214A/W214A : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$)

External bus mode : $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

| Parameter | Symbol | Pin name | Condition | Value | | | Unit | Remarks | |

| | | INT0 to INT3 | | 3 tcyc | _ | _ | ns | | |
| | | ĀTG | | 2 tcyc | _ | _ | ns | | |
| | twiwL | WI | | 4 tcyc | | _ | ns | | |

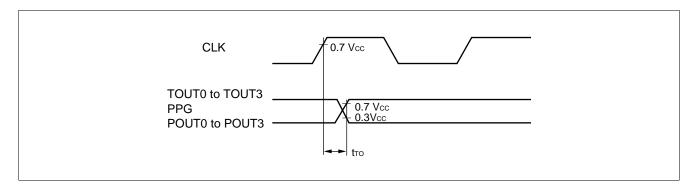

(12) Resource Output Timing

Single-chip mode MB90214/P214B/W214B : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40^{\circ}\text{C}$ to $+105^{\circ}\text{C}$)

MB90P214A/W214A : $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +85^{\circ}\text{C})$

External bus mode : $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

| Parameter | Symbol | Pin name | Condition | Value | | Unit | Remarks |
|------------------------------------------------------------------------------------|-------------|-----------------------------------|--------------------------|-------|------|-------|---------|
| Farameter | Symbol | Fill liallie | Condition | Min. | Max. | Oilit | Kemarks |
| $\begin{array}{c} CLK \uparrow \to \\ T_{OUT} \text{ transition time} \end{array}$ | t то | TOUT0 to TOUT3 PPG POUT0 to POUT3 | Load condition: 80 pF | | 30 | ns | |

5. A/D Converter Electrical Characteristics

Single-chip mode MB90214/P214B/W214B:

(AVcc = Vcc = $+5.0\pm10\%$, AVss = Vss = 0.0 V, T_A = -40° C to $+105^{\circ}$ C, +4.5 V \leq AVRH - AVRL) Single-chip mode MBP90214A/W214A:

(AVcc = Vcc = $+5.0\pm10\%$, AVss = Vss = 0.0 V, T_A = -40° C to $+85^{\circ}$ C, +4.5 V $\stackrel{\leq}{=}$ AVRH – AVRL) External bus mode:

 $(AVcc = Vcc = +5.0\pm10\%, AVss = Vss = 0.0 \text{ V}, T_A = -40^{\circ}\text{C to } +70^{\circ}\text{C}, +4.5 \text{ V} \le AVRH - AVRL)$

| Parameter | Symbol | Pin name | Condition | Value | | | | Remarks |
|----------------------------------|--------|--------------|------------------|------------|------------|------------|------|-------------------|
| | | Pili lialile | | Min. | Тур. | Max. | Unit | Remarks |
| Resolution | n | _ | _ | _ | _ | 10 | bit | |
| Total error | _ | _ | _ | -3.0 | _ | +3.0 | LSB | |
| Linearity error | _ | _ | _ | -2.0 | _ | +2.0 | LSB | |
| Differential linearity error | _ | _ | _ | _ | _ | ±1.5 | LSB | |
| Zero transition voltage | Vот | AN0 to AN7 | _ | AVRL – 1.5 | AVRL + 0.5 | AVRL + 2.5 | LSB | |
| Full-scale transition voltage | VFST | ANO IO AIN | _ | AVRH – 3.5 | AVRH – 1.5 | AVRH+ 0.5 | LSB | |
| Conversion time | Тсопу | _ | - tcyc = 62.5 ns | 6.125 | _ | _ | μs | 98 machine cycles |
| Sampling period | Тѕамр | _ | | 3.75 | _ | _ | μs | 60 machine cycles |
| Analog port input current | lain | AN0 to AN7 | _ | _ | _ | ±0.1 | μА | |
| Analog input voltage | Vain | ANO IO AIN7 | _ | AVRL | _ | AVRH | V | |
| Analog reference | _ | AVRH | _ | AVRL | _ | AVcc | V | |
| voltage | | AVRL | _ | AVss | _ | AVRH | V | |
| Reference voltage supply current | IR | AVRH | _ | _ | 200 | 500 | μΑ | |
| | IRH | AVNII | _ | _ | _ | 5* | μΑ | |
| Interchannel disparity | _ | AN0 to AN7 | _ | _ | _ | 4 | LSB | |

^{*:} The current value applies to the CPU stop mode with the A/D converter inactive (Vcc = AVcc = AVRH = +5.5 V).

Notes: (1) The smaller the | AVRH – AVRL |, the greater the error would become relatively.

- (2) Use the output impedance of the external circuit for analog input under the following conditions: External circuit output impedance < approx. 10 k Ω (Sampling period = 3.75 μ s, tcyc = 62.5 ns)
- (3) Precision values are standard values applicable to sleep mode.
- (4) If Vcc/AVcc or Vss/AVss is caused by a noise to drop to below the analog input voltage, the analog input current is likely to increase. In such cases, a bypass capacitor or the like should be provided in the external circuit to suppress the noise.

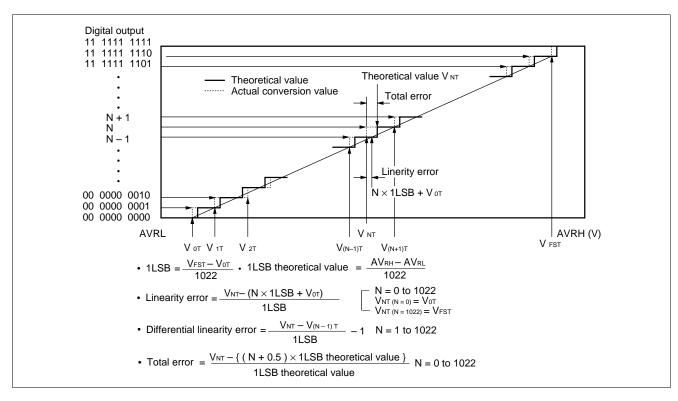

6. A/D Converter Glossary

Resolution: Analog changes that are identifiable with the A/D converter When the number of bits is 10, analog voltage can be divided into $2^{10} = 1024$.

Total error: Difference between actual and logical values. This error is caused by a zero transition error, full-scale transition error, linearity error, differential linearity error, or by noise.

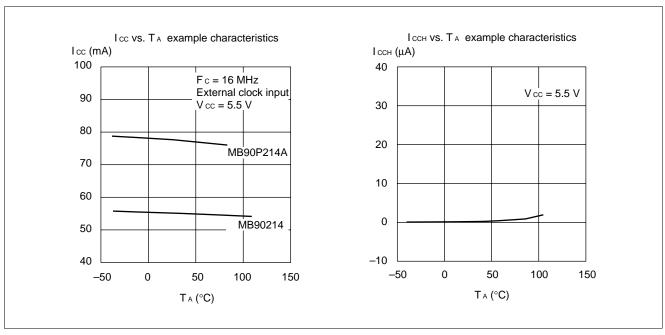

Linearity error: The deviation of the straight line connecting the zero transition point ("00 0000 0000" \leftrightarrow "00 0000 0001") with the full-scale transition point ("11 1111 1111" \leftrightarrow "11 1111 1110") from actual conversion characteristics

Differential linearity error: The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value.

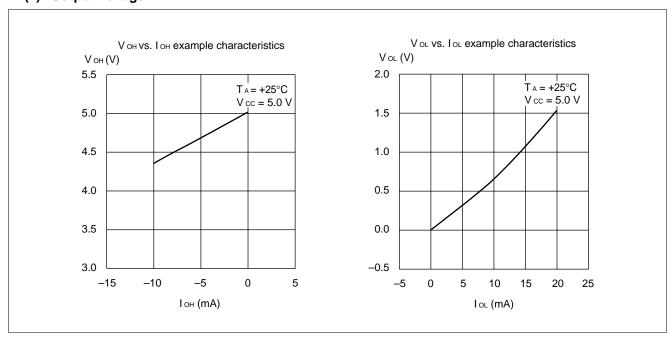

■ EXAMPLE CHARACTERISTICS

(1) Power Supply Current

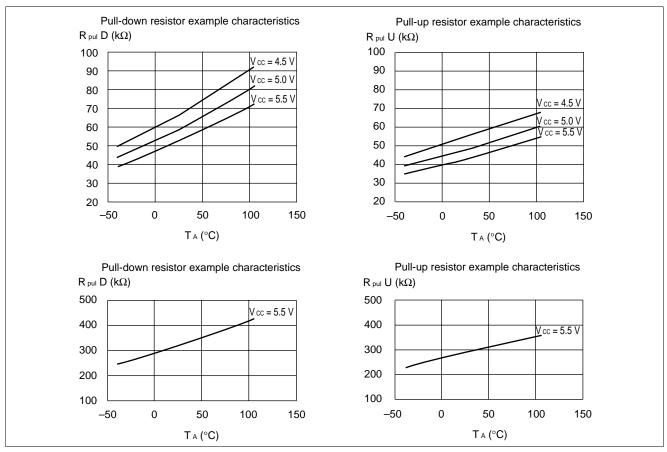

Note: These are not assured value of characteristics but example characteristics.

(2) Output Voltage

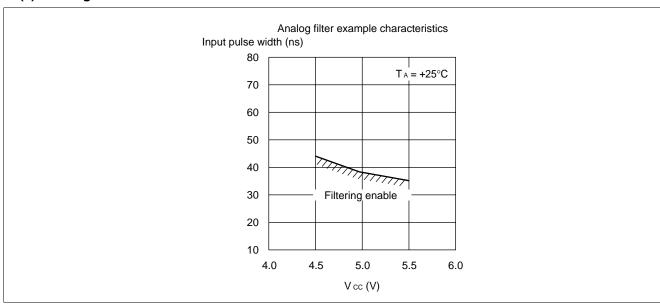

Note: These are not assured value of characteristics but example characteristics.

(3) Pull-up/Pull-down Resistor

Note: These are not assured value of characteristics but example characteristics.

(4) Analog Filter

Note: These are not assured value of characteristics but example characteristics.

■ INSTRUCTIONS (421 INSTRUCTIONS)

Table 1 Description of Items in Instruction List

| Item | Description |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mnemonic | English upper case and symbol: Described directly in assembler code. English lower case: Converted in assembler code. Number of letters after English lower case: Describes bit width in code. |
| # | Describes number of bytes. |
| ~ | Describes number of cycles. For other letters in other items, refer to table 4. |
| В | Describes correction value for calculating number of actual states. Number of actual states is calculated by adding value in the ~section. |
| Operation | Describes operation of instructions. |
| LH | Describes a special operation to 15 bits to 08 bits of the accumulator. Z: Transfer 0. X: Sign-extend and transfer. -: No transmission |
| АН | Describes a special operation to the upper 16-bit of the accumulator. * : Transmit from AL to AH. - : No transfer. Z : Transfer 00 _H to AH. X : Sign-extend AL and transfer 00 _H or FF _H to AH. |
| I | Describes status of I (interrupt enable), S (stack), T (sticky bit), N (negative), Z (zero), |
| S | V (overflow), and C (carry) flags. * : Changes after execution of instruction. |
| Т | -: No changes. |
| N | S: Set after execution of instruction. R: Reset after execution of instruction. |
| Z | |
| V | |
| С | |
| RMW | Describes whether or not the instruction is a read-modify-write type (a data is read out from memory etc. in single cycle, and the result is written into memory etc.). * : Read-modify-write instruction - : Not read-modify-write instruction Note: Not used to addresses having different functions for reading and writing operations. |

Table 2 Description of Symbols in Instruction Table

| Item | Description |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| А | 32-bit accumlator The bit length is dependent on the instructions to be used. Byte: Lower 8-bit of AL Word:16-bit of AL Long: AL: 32-bit of AH |
| AH | Upper 16-bit of A |
| AL | Lower 16-bit of A |
| SP | Stack pointer (USP or SSP) |
| PC | Program counter |
| SPCU | Stack pointer upper limited register |
| SPCL | Stack pointer lower limited register |
| PCB | Program bank register |
| DTB | Data bank register |
| ADB | Additional data bank register |
| SSB | System stack bank register |
| USB | User stack bank register |
| SPB | Current stack bank register (SSB or USB) |
| DPR | Direct page register |
| brg1 | DTB, ADB, SSB, USB, DPR, PCB |
| brg2 | DTB, ADB, SSB, USB, DPR |
| Ri | R0, R1, R2, R3, R4, R5, R6, R7 |
| RWi | RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7 |
| RWj | RW0, RW1, RW2, RW3 |
| RLi | RL0, RL1, RL2, RL3 |
| dir addr16 addr24 ad24 0 to 15 ad24 16 to 23 | Specify shortened direct address. Specify direct address. Specify physical direct address. bit0 to bit15 of addr24 bit16 to bit 23 of addr24 |
| io | I/O area (000000н to 0000FFн) |
| #imm4 #imm8 #imm16 #imm32 ext (imm8) | 4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data calculated by sign-extending an 8-bit immediate data |
| disp8 disp16 | 8-bit displacement 16-bit displacement |
| bp | Bit offset value |
| vct4 vct8 | Vector number (0 to 15) Vector number (0 to 255) |
| ()b | Bit address |
| rel ear eam | Specify PC relative branch. Specify effective address (code 00 to 07). Specify effective address (code 08 to 1F). |
| rlst | Register allocation |

Table 3 Effective Address Field

| Code | | Symbol | | Address type | Number of bytes in address extension block* |
|----------------------------------------------|----------------------------------------------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| 00 01 02 03 04 05 06 07 | R0 R1 R2 R3 R4 R5 R6 R7 | RW0 RW1 RW2 RW3 RW4 RW5 RW6 RW7 | RL0 (RL0) RL1 (RL1) RL2 (RL2) RL3 (RL3) | Register direct "ea" corresponds to byte, word, and long word from left respectively. | _ |
| 08 09 0A 0B | | @RW0 @RW1 @RW2 @RW3 | | Register indirect | 0 |
| 0C 0D 0E 0F | | @RW0 + @RW1 + @RW2 + @RW3 + | | Register indirect with post increment | 0 |
| 10 11 12 13 14 15 16 17 | @ F @ F @ F @ F @ F | RW0 + dis RW1 + dis RW2 + dis RW3 + dis RW4 + dis RW5 + dis RW6 + dis | sp8 sp8 sp8 sp8 sp8 sp8 sp8 | Register indirect with 8-bit displacement | 1 |
| 18 19 1A 1B | @R @R | W0 + dis W1 + dis W2 + dis W3 + dis | p16 p16 | Register indirect with 16-bit displacement | 2 |
| 1C 1D 1E 1F | @F | RW0 + R\ RW1 + R\ PC + disp addr16 | N7 | Register indirect with index Register indirect with index PC indirect with 16-bit displacement Direct address | 0 0 2 2 |

Note: Number of bytes for address extension corresponds to "+" in the # (number of bytes) part in the instruction table.

Table 4 Number of Execution Cycles in Addressing Modes

| Code | Operand | (a)* |
|----------------------|----------------------------------------------------|-------------------------------------------------|
| Code | Operand | Number of execution cycles for addressing modes |
| 00 to 07 | Ri RWi RLi | Listed in instruction table |
| 08 to 0B | @RWj | 1 |
| 0C to 0F | @RWj + | 4 |
| 10 to 17 | @RWi + disp8 | 1 |
| 18 to 1B | @RWj + disp16 | 1 |
| 1C 1D 1E 1F | @RW0 + RW7 @RW1 + RW7 @PC + disp16 addr16 | 2 2 2 1 |

Note: (a) is used for ~ (number of cycles) and B (correction value) in instruction table.

Table 5 Correction Value for Number of Cycles for Calculating Actual Number of Cycles

| Onevend | (b)* | (c)* | (d)* |
|-----------------------------------------------------------------------------|----------|----------|----------|
| Operand | byte | word | long |
| Internal register | +0 | +0 | +0 |
| Internal RAM even address Internal RAM odd address | +0 +0 | +0 +1 | +0 +2 |
| Other than internal RAM even address Other than internal RAM odd address | +1 +1 | +1 +3 | +2 +6 |
| External data bus 8-bit | +1 | +3 | +6 |

Notes: (b), (c), (d) is used for ~ (number of cycles) and B (correction value) in instruction table.

For (b) and (c), refer to "Table 5 Correction Values for Number of Cycles for Calculating Actual Number of Cycles."

- *1: Set to 3 for divide-by-0, 8 or 18 for an overflow, and 18 for normal operation.
- *2: Set to 3 for divide-by-0, 10 or 21 for an overflow, and 22 for normal operation.
- *3: Set to 4 + (a) for divide-by-0, 11 + (a) or 22 + (a) for an overflow, and 23 + (a) for normal operation.
- *4: Positive divided: Set to 4 for divide-by-0, 10 or 29 for an overflow, and 30 for normal operation. Negative divided: Set to 4 for divide-by-0, 11 or 30 for an overflow, and 31 for normal operation.
- *5: Positive divided: Set to 4 + (a) for divide-by-0, 11 + (a) or 30 + (a) for an overflow, and 31 + (a) for normal operation. Negative divided: Set to 4 + (a) for divide-by-0, 12 + (a) or 31 + (a) for an overflow, and 32 + (a) for normal operation.
- *6: Set to (b) when the division-by-0 or an overflow, and $2 \times (b)$ for normal operation.
- *7: Set to (c) when the division-by-0 or an overflow, and $2 \times$ (c) for normal operation.
- *8: Set to 3 when byte (AH) is zero, 12 when the result is positive, and 13 when the result is negative.
- *9: Set to 3 when byte (ear) is zero, 12 when the result is positive, and 13 when the result is negative.
- *10:Set to 4 + (a) when byte (eam) is zero, 13 + (a) when the result is positive, and 14 + (a) when the result is negative.
- *11:Set to 3 when word (AH) is zero, 12 when the result is positive, and 13 when the result is negative.
- *12:Set to 3 when word (ear) is zero, 16 when the result is positive, and 19 when the result is negative.
- *13:Set to 4 + (a) when word (eam) is zero, 17 + (a) when the result is positive, and 20 + (a) when the result is negative.

Note: When overflow occurs during DIV or DIVW instruction execution, the number of execution cycles takes two values because of detection before and after an operation.

When overflow occurs during DIV or DIVW instruction execution, the contents of AL are destroyed.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
