DS07-13608-1E

# 16-bit Proprietary Microcontroller

**CMOS** 

# F<sup>2</sup>MC-16L MB90640A Series

## MB90641A/P641A

### **■ DESCRIPTION**

MB90640A series includes 16-bit microcontrollers optimally suitable for process control in a wide variety of industrial and OA equipment. The series uses the F<sup>2</sup>MC\*-16L CPU which is based on the F<sup>2</sup>MC-16 but with enhanced high-level language and task switching instructions and additional addressing modes.

The internal peripheral resources consist of a 2-channel serial port incorporating a UART function (and supporting I/O expansion serial mode), 8/16-bit 2-channel PPG, 5-channel 16-bit reload timer, 8-channel chip select function, and 8-channel DTP/external interrupts.

Also, multiplexed or non-multiplexed operation can be selected for the address/data bus.

\*: F2MC stands for FUJITSU Flexible Microcontroller.

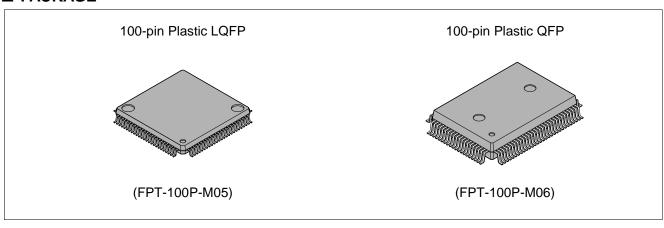

### **■ FEATURES**

#### F<sup>2</sup>MC-16L CPU

- Minimum instruction execution time: 58.8 ns/4.25 MHz oscillation (Uses PLL clock multiplication), maximum multiplier = 4
- Instruction set optimized for controller applications
   Upward object code compatibility with F²MC-16 (H)
   Wide range of data types (bit/byte/word/long word)
   Improved instruction cycles provide increased speed
   Additional addressing modes: 23 modes

(Continued)

#### ■ PACKAGE

### (Continued)

High code efficiency

Access methods (bank access/linear pointer)

Enhanced multiplication and division instructions (signed instructions added)

High precision operations are enhanced by use of a 32-bit accumulator

Extended intelligent I/O service (access area extended to 64 Kbytes)

Maximum memory space: 16 Mbytes

• Enhanced high level language (C)/multitasking support instructions

Use of a system stack pointer

Enhanced pointer indirect instructions

Barrel shift instructions

Stack check function

- Improved execution speed: Four byte instruction queue
- Powerful interrupt function
- Automatic data transfer function (does not use instructions)

### Internal peripherals

- RAM: 2 Kbytes
- General purpose ports Data bus, multiplexed mode: 56 ports max.

Non-multiplexed mode: 48 ports max. Single-chip mode: 75 ports max.

• UART0, 1 (SCI): 2 channels

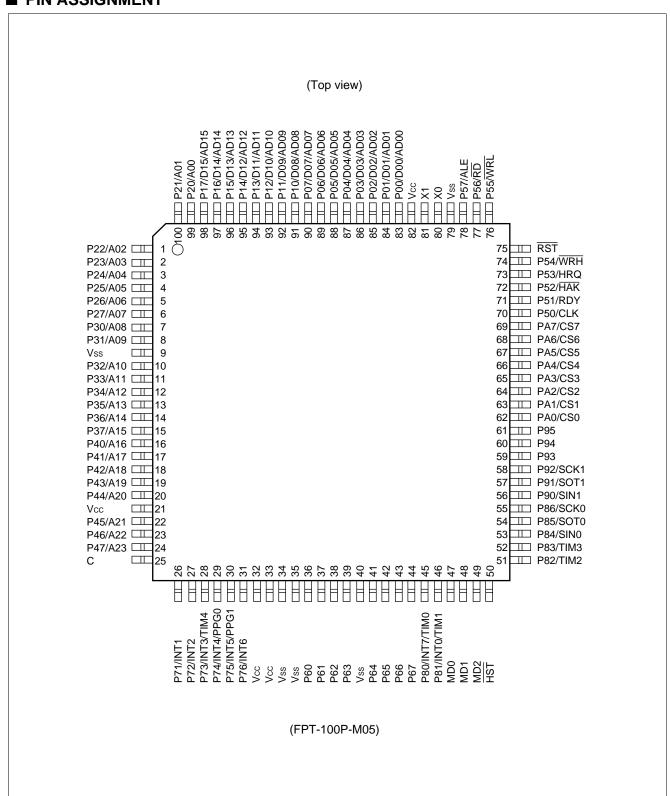

For either asynchronous or clocked serial transfer (I/O expansion serial)

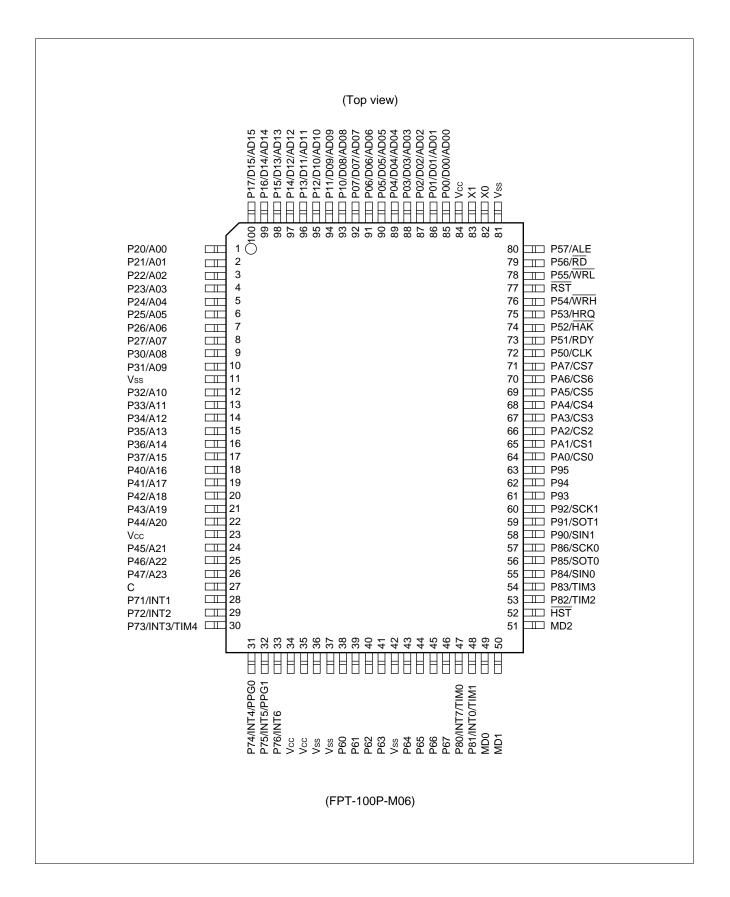

- 8/16-bit PPG (programmable pulse generator): 2 channels
- 16-bit reload timer: 5 channels
- Chip select function: 8 channels
- DTP/external interrupts: 8 channels
- Timebase timer/watchdog timer
- PLL clock multiplier function
- CPU intermittent operation function
- · Various standby modes
- Packages: LQFP-100 and QFP-100
- CMOS technology

## **■** PRODUCT LINEUP

Part number	MB90641A	MB90P641A				
Item		9 11 55 01				
Classification	Mask ROM	One-time PROM				
ROM size	64 Kbytes	64 Kbytes				
RAM size	2 Kbytes	2 Kbytes				
CPU functions	The number of instructions: 340 Instruction bit length: 8/16 bits Instruction length: 1 to 7 bytes Data bit length: 1/4/8/16/32 bits Minimum execution time: 58.8 ns at 4.25 MHz (PLL multiplier = 4) Interrupt processing time: 941 ns at 17 MHz (minimum)					
Ports	8/16-bit data bus, multiplexed mode: 56 ports (max) 8-bit non-multiplexed mode: 48 ports (max) Single-chip mode: 75 ports (max)					
Packages		0P-M05 0P-M06				
UART0, 1 (SCI)	Full-duplex, de Selectable clock synchronou	nal UARTs ouble-buffered is or asynchronous operation paud rate generator				
8/16-bit PPG		PG outputs tput in 16-bit mode)				
16-bit reload timer	(Selectable count clock: 0.125 μs, 0.5 μ	rable toggle output, one-shot output) s, or 2.0 μs for a 16 MHz machine cycle) nction, 5 internal channels				
Chip select function	8 ou	tputs				
DTP/external interrupts	8 inputs External interrupt mode (Interrupts can be generated from four different types of request signal)					
PLL function	Selectable multiplier: 1/2/3/4 (Set a multiplier that does not exceed the assured operation frequency range.)					
External bus terminal control circuit	Multiplex and non-multiplex between the	adress pin and the data pin is selectable.				

### **■ PIN ASSIGNMENT**

### **■ PIN DESCRIPTION**

Pin no.			Circuit	
LQFP*1	QFP*2	Pin name	type	Function
80, 81	82, 83	X0, X1	А	Crystal oscillator pins
47 to 49	49 to 51	MD0 to MD2	E (CMOS)	Input pins for specifying an opration mode. Use these pins by directly connecting Vcc or Vss.
75	77	RST	G (CMOS/H)	External reset request input pin
50	52	HST	F (CMOS/H)	Hardware standby input pin
83 to 90	85 to 92	P00 to P07	J (TTL)	General purpose I/O ports This applies in single-chip mode with an external data bus in 8-bit mode.
		D00 to D07		In non-multiplex mode, the I/O pins for the lower 8 bits of the external data bus.
		AD00 to AD07		In multiplexed mode, the I/O pins for the lower 8 bits of the external address/data bus.
91 to 98	93 to 100	P10 to P17	J (TTL)	General purpose I/O ports This applies in non-multiplexed mode with an 8-bit external data bus and in single-chip mode.
		P08 to D15		In non-multiplexed mode with a 16-bit external data bus, the I/O pins for the upper 8 bits of the external data bus.
		AD08 to AD15		In multiplexed mode, the I/O pins for the upper 8 bits of the external address/data bus.
99, 100, 1 to 6	1, 2, 3 to 8	P20, P21, P22 to P27	B (CMOS)	General purpose I/O ports This applies in multiplexed mode.
		A00, A01, A02 to A07		In non-multiplexed mode, the output pins for the lower 8 bits of the external address bus.
7, 8, 10 to 15	9, 10, 12 to 17	P30, P31, P32 to P37	B (CMOS)	General purpose I/O ports This applies in multiplexed mode.
		A08, A09, A10 to A15		In non-multiplexed mode, the output pins for the upper 8 bits of the external address bus.
16 to 20, 22 to 24	18 to 22, 24 to 26	P40 to P44, P45 to P47	B (CMOS)	General purpose I/O ports This applies when the upper address control register specifies port operation.
		A16 to A20, A21 to A23		Output pins for A16 to A23 of the external address bus This applies when the upper address control register specifies address operation.

\*2: FPT-100P-M06

Pin	no.	Din nama	Circuit	Firmation	
LQFP*1	QFP*2	Pin name	type	Function  Conord purpose I/O part	
70	72	P50	(CMOS)	General purpose I/O port This applies when CLK output is disabled.	
		CLK		CLK output pin This applies when CLK output is enabled.	
71	73	P51	K (TTL)	General purpose I/O port This applies when the external ready function is disabled.	
		RDY		Ready input pin This applies when the external ready function is enabled.	
72	74	P52	(CMOS)	General purpose I/O port This applies when the hold function is disabled.	
		HAK		Hold acknowledge output pin This applies when the hold function is enabled.	
73	75	P53	K (TTL)	General purpose I/O port This applies when the hold function is disabled.	
		HRQ		Hold request input pin This applies when the hold function is enabled.	
74	76	P54	(CMOS)	General purpose I/O port This applies in 8-bit external bus mode or when output is disabled for the WRH pin.	
		WRH		Write strobe output pin for the upper 8 bits of the data bus This applies in 16-bit external bus mode and when output is enabled for the WRH pin.	
76	78	P55	(CMOS)	General purpose I/O port This applies when output is disabled for the WRL pin.	
		WRL		Write strobe output pin for the lower 8 bits of the data bus This applies when output is enabled for the $\overline{WRL}$ pin.	
77	79	P56	(CMOS)	General-purpose I/O port This port is available in the single-chip mode.	
		RD		Read strobe output pin for the data bus	
78	80	P57	(CMOS)	General-purpose I/O port This port is available in the single-chip mode.	
		ALE		Address latch enable output pin	
36 to 39, 41 to 44	38 to 41, 43 to 46	P60 to P67	С	Open-drain output ports

<sup>\*2:</sup> FPT-100P-M06

### **■ I/O CIRCUIT TYPE**

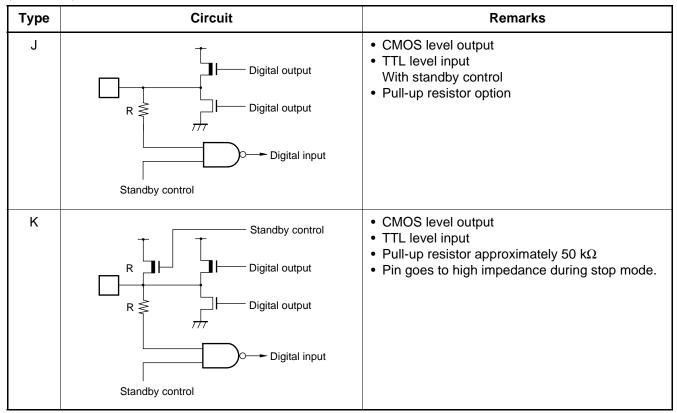

Note: For pins with pull-up resistors, the resistance is disconnected when the pin outputs the "L" level or when in the standby state.

Туре	Circuit	Remarks
Е	R Digital input	CMOS level input     No standby control     Pull-up resistor option
F	R Digital input	CMOS level hysteresis input     No standby control     Pull-up resistor option
G	R R Digital input	CMOS level hysteresis input     No standby control     With pull-up resistor
Н	Digital output  R  Digital output  Digital input	CMOS level output CMOS level hysteresis input No standby control Pull-up resistor option
I	Standby control  R  Digital output  Digital output  Digital input  Standby control	<ul> <li>CMOS level output</li> <li>CMOS level hysteresis input</li> <li>Pull-up resistor approximately 50 kΩ</li> <li>Pin goes to high impedance during stop mode.</li> </ul>

Note: For pins with pull-up resistors, the resistance is disconnected when the pin outputs the "L" level or when in the standby state.

### (Continued)

Note: For pins with pull-up resistors, the resistance is disconnected when the pin outputs the "L" level or when in the standby state.

### **■ HANDLING DEVICES**

### 1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than Vcc or less than Vss is applied to input and output pins other than medium- and high-voltage pins or if higher than the voltage which shows on "1. Absolute Maximum Ratings" in "Electrical Characteristics" is applied between Vcc and Vss.

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

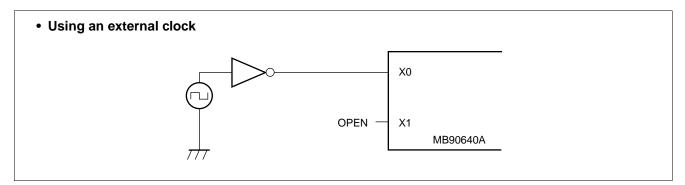

Also, take care to prevent the analog power supply (AVcc and AVR) and analog input from exceeding the digital power supply (Vcc) when the analog system power supply is truned on and off.

#### 2. Treatment of Unused Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resister.

### 3. Cautions when Using an External Clock

Drive the X0 pin only when using an external clock.

### 4. Power Supply Pins

When there are several V<sub>CC</sub> and V<sub>SS</sub> pins, those pins that should have the same electric potential are connected within the device when the device is designed in order to prevent misoperation, such as latchup. However, all of those pins must be connected to the power supply and ground externally in order to reduce unnecessary emissions, prevent misoperation of strobe signals due to an increase in the ground level, and to observe the total output current standards.

In addition, give a due consideration to the connection in that current supply be connected to Vcc and Vss with the lowest possible impedance.

Finally, it is recommended to connect a ceramic capacitor of about 0.1  $\mu$ F between  $V_{CC}$  and  $V_{SS}$  near this device as a bypass capacitor.

### 5. Crystal Oscillation Circuit

Noise in the vicinity of the X0 and X1 pins will cause this device to operate incorrectly. Design the printed circuit board so that the bypass capacitor connecting X0, X1 and the crystal oscillator (or ceramic oscillator) to ground is located as close to the device as possible, and possibly take care not to cross over the other wiring with this wiring.

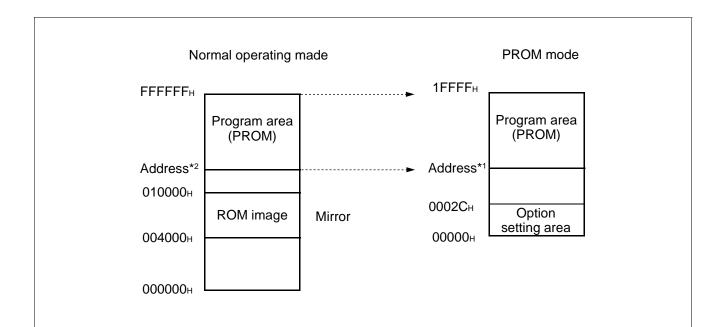

In addition, because printed circuit board artwork in which the area around the X0 and X1 pins is surrounded by ground provides stable operation, such an arrangement is strongly recommended.

### ■ PROGRAMMING TO THE ONE-TIME PROM ON THE MB90P641A

MB90P641A has a function PROM mode function equivalent to MBM27C1000/1000A, so it can be written by general ROM writer using special adapter. But take attention it doesn't corsespond to the elctronic signature (the device identification code) mode.

### 1. Programming Procedure

Memory map in the PROM mode is as below. Write option data to the option setting erea refering to the 6 PROM option bit map.

Product	Address*1	Address*2	Number of bytes	
MB90P641A	10000н	FF0000н	64 Kbytes	

Note: The 00 bank ROM image is 48 Kbyes. (This is a ROM image for FF4000<sub>H</sub> to FFFFFF<sub>H</sub>. Only when the ROM mirror function selecting resister is enable.)

Porocedure of the programing to the one-time PROM microcomputer is as below.

- (1) Set the EPROM programmer for the MBM27C1000/1000A.
- (2) Load the program data into the EPROM programmer at address\*1 to 1FFFFH. When specify the PROM option, load the option data to 00000H to 00002CH to referring to "6. PROM Option Bitmap".
- (3) Insert the device in the socket adapter, and mount the socket adapter on the EPROM programmer. Pay attention to the orientation of the device and of the socket adapter when doing so.
- (4) Program to 00000H to 1FFFFH.

Notes: • Because the mask ROM products do not have a PROM mode, they cannot read date from the EPROM programmer.

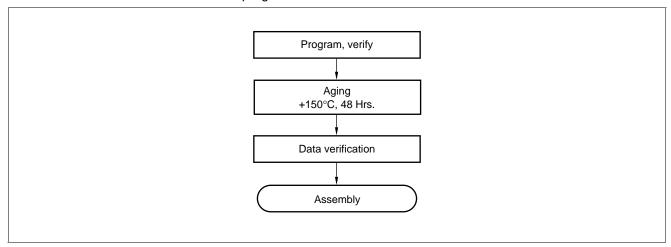

• Contact the sales department when purchasing an EPROM programmer.

### 2. Program Mode

In the MB90P641A, all of the bits are set to "1" when the IC is shipped from Fujitsu and after erasure. To input data, program the IC by selectively setting the desired bits to "0". Bits cannot be set to "1" electrically.

### 3. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked one-time PROM with microcontroller program.

### 4. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked one-time PROM microcomputer, due to its nature. For this reason, a programming yield of 100% cannot be assured at all times.

### 5. EPROM Programmer Socket Adapter and Recommended Programmer Manuffacturer

### Initial values

- 0: The initial value for this bit is "0".
- 1: The initial value for this bit is "1".
- \*: The initial value for this bit is "1" or "0". (Determined by the level of the MD0 to MD2 pins.)
- X: The initial value for this bit is undefined.
- -: This bit is not used. The initial value is undefined.
- \*1: Access prohibited.
- \*2: This is the only external access area in the area below address 0000FF<sub>H</sub>. Access this address as an external I/O area.
- \*3: Areas marked as "Vacancy" in the I/O map are reserved areas. These areas are accessed by internal access. No access signals are output on the external bus.
- \*4: The R/W! symbol in the read/write column indicates that some bits are read-only or write-only. See the resource's register list for details.

- \*5: Using a read-modify-write instruction (such as the bit set instruction) to access one of the registers indicated by R/W!, R/W\*, or W in the read/write column sets the specified bit to the desired value. However, this can cause misoperation if the other register bits include write-only bits. Therefore, do not use read-modify-write instructions to access these registers.
- \*6: This register is only available when the address/data bus is in multiplex mode and in single-chip mode. Access to the register is prohibited in non-multiplex mode.
- \*7: This register is only available when the external data bus is in 8-bit mode and in single-chip mode. Access to the register is prohibited in 16-bit mode.
- \*8: All bits of DDR0/PDR0, 6-bit/7-bit of DDR5/PDR5 and 0-bit of DDRA/PDRA are available only in single-chip mode.
- \*9: The initial value of this register in MB90V640A is "0" and that of in MB90P641A, MB90641A is "1".
- Note: The initial values listed for write-only bits are the initial values set by a reset. Take attention that they are not the values returned by a read.
  - Also, LPMCR/CKSCR/WDTC are sometimes initialized and sometimes not initialized, depending on the reset type. The listed initial values are for when these registers are initialized.

<sup>○ :</sup> indicates that the interrupt request flag is cleared by the I²OS interrupt clear signal (no stop request).

Note: Do not specify I<sup>2</sup>OS activation in interrupt control registers that do not support I<sup>2</sup>OS.

①: indicates that the interrupt request flag is cleared by the I2OS interrupt clear signal (with stop request).

 $<sup>\</sup>times\,$  : indicates that the interrupt request flag is not cleared by the I2OS interrupt clear signal.

### **■ PERIPHERAL RESOURCES**

#### 1. Parallel Port

The MB90640A series has 75 I/O pins, and 8 open-drain output pins.

Ports 0 to 5 and ports 7 to 9 and A are I/O ports. The ports are inputs when the corresponding direction register bit is "0" and outputs when the corresponding bit is "1".

Port 0 is only available in single-chip mode.

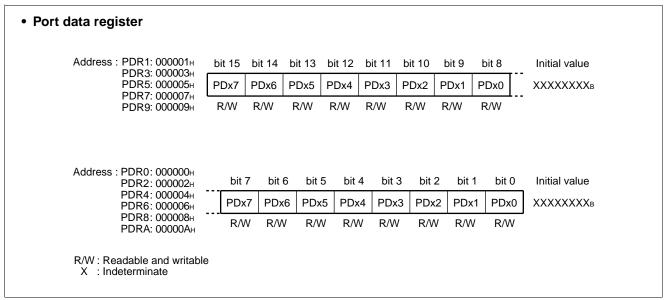

Port 1 is only available when in data bus 8-bit mode of non-multiplex mode or in single-chip mode.

Ports 2 and 3 are only available when the address/data bus is in multiplex mode and single-chip mode.

Port 6 is an open-drain port.

### (1) Register Details

Port data registers

Note: No register bit is provided for bits 0, 7 of port 7.

No register bit is provided for bit 7 of port 8.

No register bits are provided for bits 7, 6 of port 9.

Port 0 is only available in single-chip mode.

Bits 7, 6 of port 5 and bit 0 of port A are only available in single-chip mode.

Port 1 is only available when the external data bus is in 8-bit mode and single-chip mode.

Ports 2, 3 are only available in multiplex mode and single-chip mode.

Each port pin except port 6 can be specified as either an input or output by its corresponding direction register when the pin is not set for use by a peripheral. When a port is set as an input, reading the data register always reads the value corresponding to the pin level. When a port is set as an output, reading the data register reads the data register latch value. The same applies when reading using a read-modify-write instruction.

When used as control outputs, reading the data register reads the control output value, irrespective of the direction register value.

Notes: • If read-modify-write instructions (bit set instruction, etc.) are used to access this register, the bit that is the focus of the instruction is set to the prescribed value, but the contents of the output register corresponding to any other bits for which the input setting has been made are overwritten with the current input value of the corresponding pin. Therefore, when switching a pin that was being used for input over to output, first write the desired value to PDR, and then set the data DDR as output direction.

• Reading and writing an I/O port differs from reading and writing memory as follows:

### Input mode

Reads: The read data is the level of the corresponding pin.

Writes: The write data is stored in the output latch. The data is not output to the pin.

#### Output mode

Reads: The read data is the value stored in the PDR.

Writes: The write data is both stored in the output latch and output to the pin.

• Take attention that the operation of R/W in port 6 is different from that of in other port.

Port 6 (P67 to P60) is an general-purpose I/O port with an open-drain output. When port 6 is used as a general-purpose port, always be sure to set the corresponding bits in DDR6 to "0".

When port 6 is used as an input port, it is necessary set the output port data register value to "1" in order to turn off the open-drain output transistor; it is also necessary to connect a pull-up resistor to the external pins.

In addition, depending on the instruction used to read these bits, one of the following two different operations is performed:

- When read by a read-modify-write instruction:
   The contents of the output port data register are read. Even if pins are forcibly set to "0" externally, the contents of the bits not specified by the instruction do not change.
- When read by any other instruction:

  The print level and be asset.

The pin level can be read.

When used as output ports, the pin values can be changed by writing the desired value to the corresponding output port data register.

In addition, the pin which corresponds to the bit of which port 6 direction register is set to "1" can be read "0".

### · Port direction registers

Note: No register bit is provided for bits 0, 7 of port 7.

No register bit is provided for bit 7 of port 8.

No register bits are provided for bits 6, 7 of port 9.

Port 1 is only available in single-chip mode.

Port 1 is only available when the external data bus is in 8-bit mode and single-chip mode.

Ports 2, 3 are only available in multiplex mode and single-chip mode.

When pins are used as ports, the register bits control the corresponding pins as follows.

0: Input mode

1: Output mode

Bits are set to "0" by a reset.

• Port 6 direction register

### • Port 6 direction register

bit 13 bit 12 bit 11 bit 8 bit 15 bit 14 bit 10 bit 9 Initial value Address: DDR6: 000016H DD67 DD66 DD65 DD64 DD63 DD62 DD61 DD60 11111111в R/W R/W R/W R/W R/W R/W R/W R/W

R/W: Readable and writable

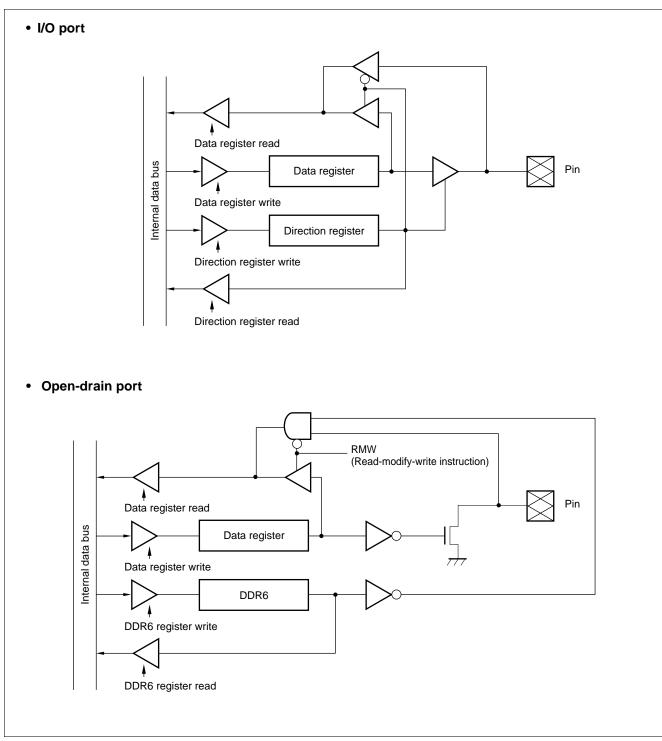

Controls each pin of port 6 as follows.

0: Port input mode

1: Analog input mode

Bits are set to "1" by a reset.

### (2) Block Diagrams

### (3) Port Pin Allocation

Ports 1, 4, and 5 on the MB90640A series share pins with the external bus. The pin functions are determined by the bus mode and register settings.

	Function								
Pin name	Non-multiplex mode				Multiplex mode				
	External address control				External address control				
	Enable (address)		Disable (port)		Enable (address)		Disable (port)		
	External bus width		External bus width		External bus width		External bus width		
	8 bits	16 bits	8 bits	16 bits	8 bits	16 bits	8 bits	16 bits	
D07 to D00/ AD07 to AD00	D07 to D00 AD07 to AD00								
P17 to P10/ D15 to D08/ AD15 to AD08	Port	D15 to D08	Port	D15 to D08	A15 to A08	AD15 to AD08	A15 to A08	AD15 to AD08	
P27 to P20/ A07 to A00	A07 to A00				Port				
P37 to P30/ A15 to A08	A15 to A08				Poit				
P47 to P40/ A23 to A16	A23 to A16 Port		ort	A23 to A16 Port			ort		
P57/ALE		AL	.E		ALE				
RD	RD				RD				
P55/WRL	WRL			WRL					
P54/WRH	Port	WRH	Port	WRH	Port	WRH	Port	WRH	
P53/HRQ	HRQ			HRQ					
P52/HAK	HAK				HAK				
P51/RDY	RDY				RDY				
P50/CLK	CLK				CLK				

Notes: • The upper address, WRL, WRH, HAK, HRQ, RDY, and CLK can be set for use as ports by function selection.

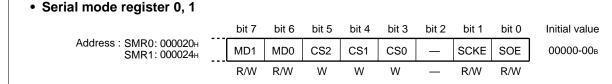

<sup>•</sup> The pins mentioned above can be used as a port in single-chip mode.

### 2. UARTO, 1 (SCI)

UARTO, 1 are serial I/O ports that can be used for CLK asynchronous (start-stop synchronization) or CLK synchronous (I/O expansion serial) data transfer. The ports have the following features.

- Full duplex, double buffered
- Supports CLK asynchronous (start-stop synchronization) and CLK synchronous (I/O expansion serial) data transfer
- Multi-processor mode support
- Built-in dedicated baud rate generator
   CLK asynchronous: 62500 bps/31250 bps/19230 bps/9615 bps/4808 bps/2404 bps/1202 bps
   CLK synchronous: 2 Mbps/1 Mbps/500 kbps/250 kbps
- Supports flexible baud rate setting using an external clock
- Error detect function (parity, framing, and overrun)
- NRZ type transmission signal
- Intelligent I/O service support

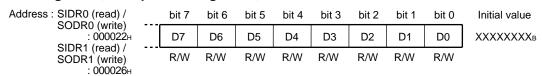

### (1) Register Configuration

• Serial control register 0, 1

• Input data register 0, 1/output data register 0, 1

Serial status register 0, 1

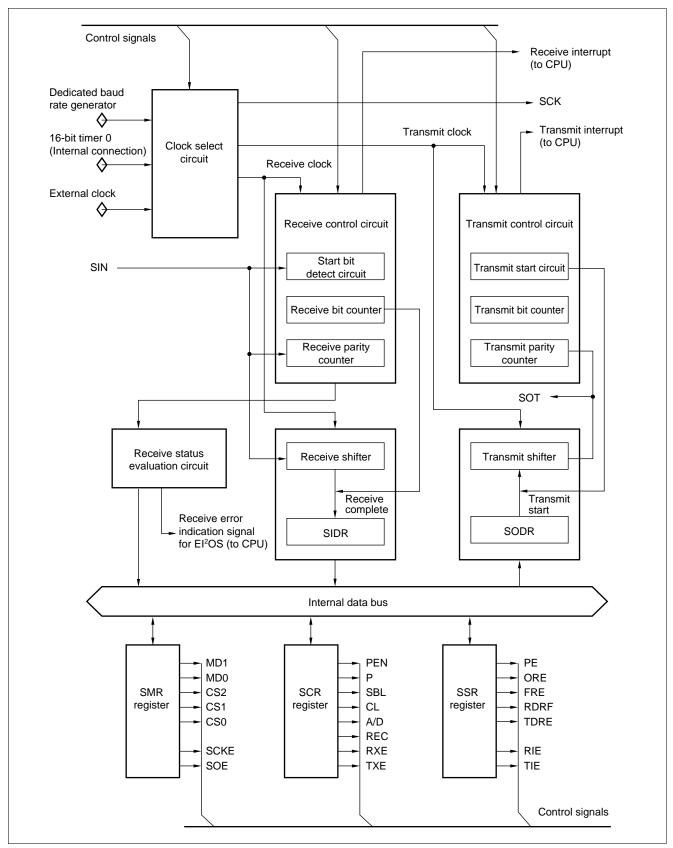

• Machine clock division control register for UARTO, 1 (SCI)

R : Read only W : Write only — : Unused X : Indeterminate

### (2) Block Diagram

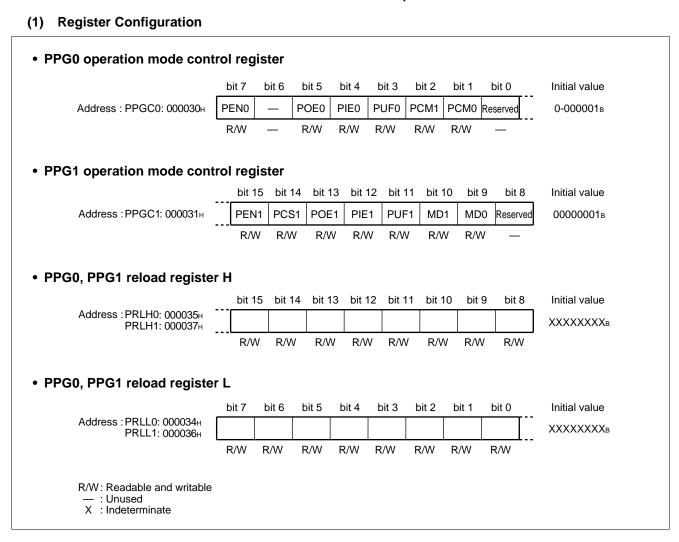

### 3. 8/16-bit PPG

8/16-bit PPG contains the 8-bit reload timer module. The block performs PPG output in which the pulse output is controlled by the operation of the timer.

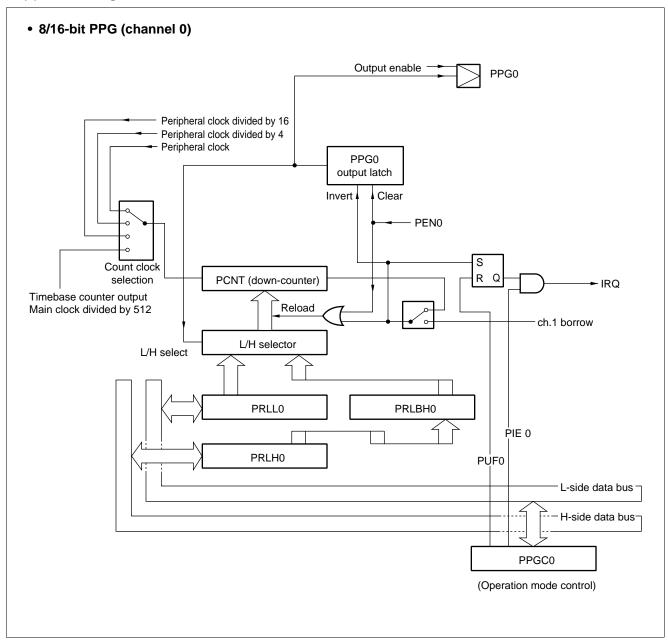

The hardware consists of two 8-bit down-counters, four 8-bit reload registers, one 16-bit control register, two external pulse output pins, and two interrupt outputs. The PPG has the following functions.

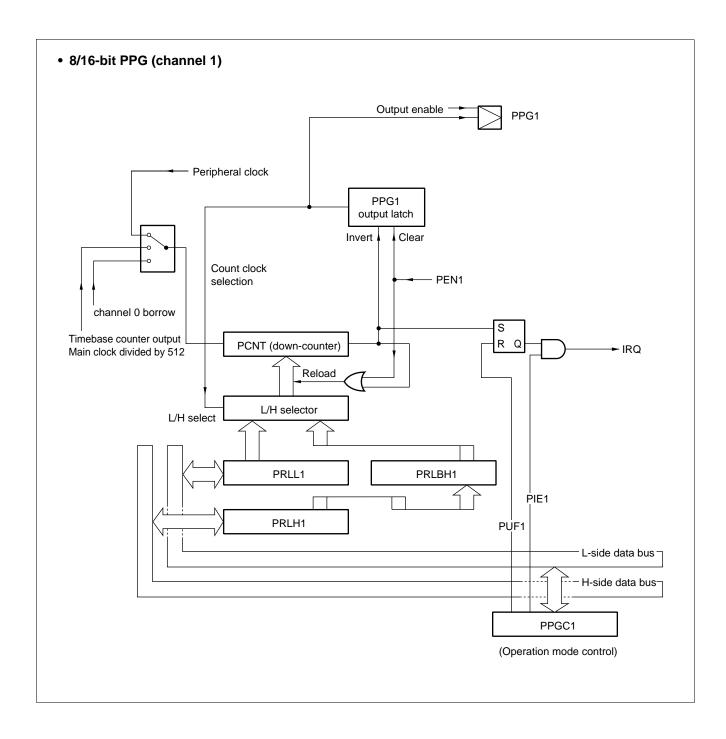

- 8-bit PPG output in 2-channel independent operation mode: Two independent PPG output channels are available.
- 16-bit PPG output operation mode: One 16-bit PPG output channel is available.
- 8+8-bit PPG output operation mode: Variable-period 8-bit PPG output operation is available by using the output of channel 0 as the clock input to channel 1.
- PPG output operation: Outputs pulse waveforms with variable period and duty ratio.

  Can be used as a D/A converter in conjunction with an external circuit.

### (2) Block Diagram

### 4. 16-bit Reload Timer (with Event Count Function)

The 16-bit reload timers consists of a 16-bit down-counter, a 16-bit reload register, input pin (TIN), output pin (TOT), and a control register. The input clock can be selected from one external clock and three types of internal clock. The output (TOT) outputs a toggle waveform in reload mode and a rectangular waveform during counting in one-shot mode. The input (TIN) functions as the event input in event count mode and as the trigger input or gate input in internal clock mode.

Input and output of timer pin TIM0 to TIM4 are set by way of the timer pin control register.

This product has five internal 16-bit reload timer channels.

#### 5. Chip Select Function

This module generates chip select signals to simplify connection of memory or I/O devices.

The module has 8 chip select output pins. The hardware outputs the chip select signals from the pins when it detects access of an address in the areas specified in the pin registers.

#### (1) Register Configuration

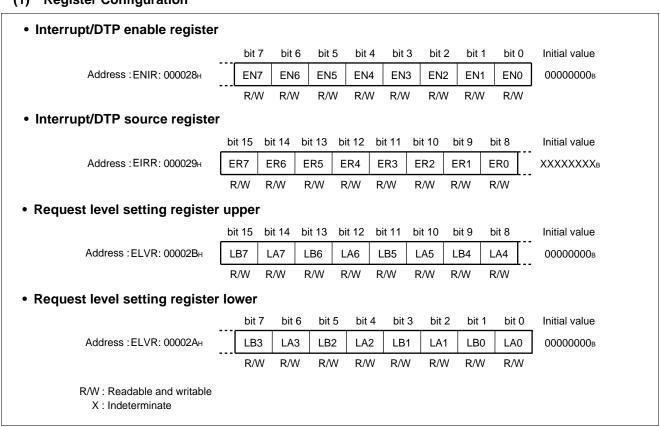

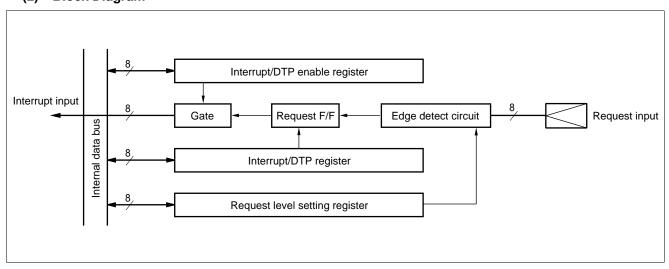

### 6. DTP/External Interrupts

The DTP (Data Transfer Peripheral) is a peripheral block that interfaces external peripherals to the F²MC-16L CPU. The DTP receives DMA and interrupt processing requests from external peripherals and passes the requests to the F²MC-16L CPU to activate the extended intelligent I/O service or interrupt processing. Two request levels ("H" and "L") are provided for extended intelligent I/O service. For external interrupt requests, generation of interrupts on a rising or falling edge as well as on "H", "L" levels can be selected, giving a total of four types.

### (1) Register Configuration

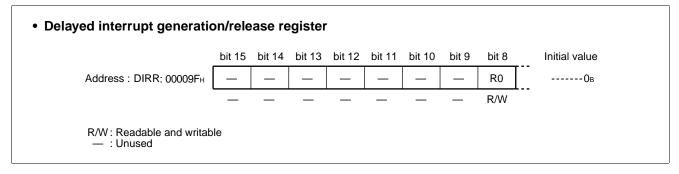

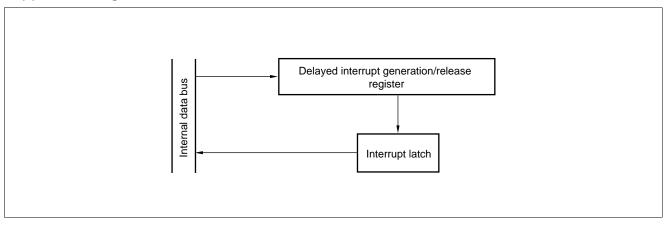

### 7. Delayed Interrupt Generation Module

The delayed interrupt generation module is used to generate the task switching interrupt. Interrupt requests to the F<sup>2</sup>MC-16L CPU can be generated and cleared by software using this module.

## (1) Register Configuration

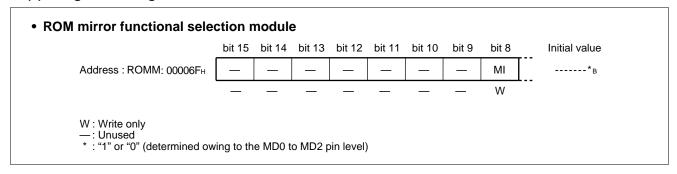

#### 8. ROM Mirror Functional Selection Module

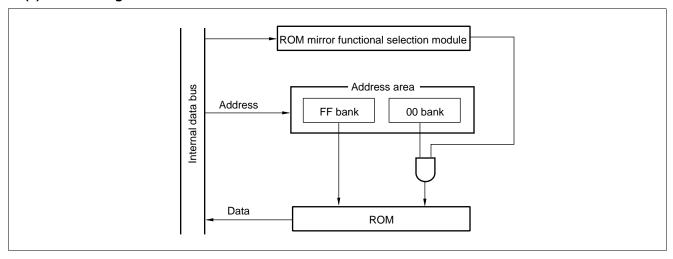

ROM mirror function selecting module can be referred to the upper 48 Kbytes of FF bank which is wired ROM at 00 bank by selecting the resister setting.

#### (1) Register Configuration

Notes: • The initial value of MB90V640A is "0" and that of MB90P641A, MB90641A is "1".

• Not to access to this register while address 04000H to 00FFFFH are in operation.

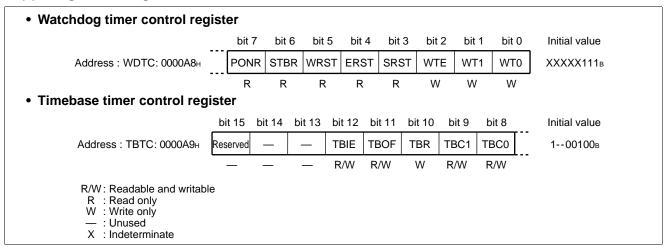

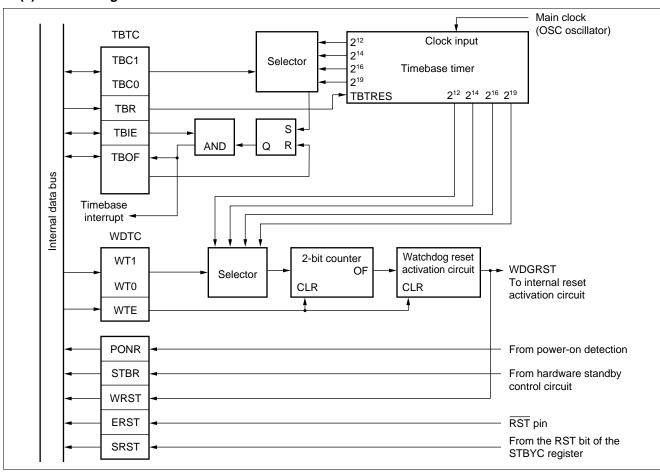

### 9. Watchdog Timer and Timebase Timer

The watchdog timer consists of a 2-bit watchdog counter, a control register, and a watchdog reset controller. The watchdog counter uses the carry-up signal from the 18-bit timebase timer as its clock source.

In addition to the 18-bit timer, the timebase timer contains an interval interrupt control circuit. The timebase timer uses the main clock, regardless of the value of the MCS bit in the CKSCR register.

#### (1) Register Configuration

# 10. Low-power Control Circuits (CPU Intermittent Operation Function, Oscillation Stabilization Delay Time, and Clock Multiplier Function)

The following operation modes are available: PLL clock mode, PLL sleep mode, timer mode, main clock mode, main sleep mode, stop mode, and hardware standby mode. Operation modes other than PLL clock mode are classified as low-power consumption modes.

In main clock mode and main sleep mode, the device operates on the main clock only (OSC oscillator clock). The PLL clock (VCO oscillator clock) is stopped in these modes and the main clock divided by 2 is used as the operating clock.

In PLL sleep mode and main sleep mode, the CPU's operating clock only is stopped and other elements continue to operate.

In timer mode, only the timebase timer operates.

Stop mode and hardware standby mode stop the oscillator. These modes maintain existing data with minimum power consumption.

The CPU intermittent operation function provides an intermittent clock to the CPU when register, internal memory, internal resource, or external bus access is performed. This function reduces power consumption by lowering the CPU execution speed while still providing a high-speed clock to internal resources.

The PLL clock multiplier ratio can be set to 1, 2, 3, 4 by the CS1, CS0 bits.

The WS1, WS0 bits set the delay time to wait for the main clock oscillation to stabilize when recovering from stop mode or hardware standby mode.

#### (1) Register Configuration

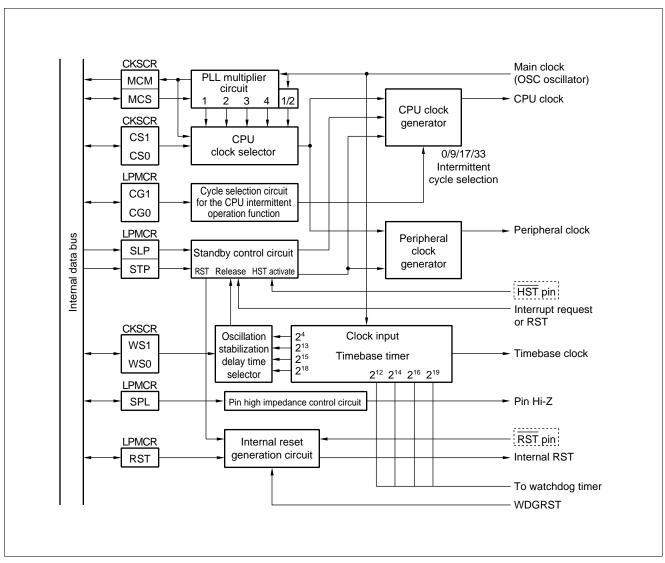

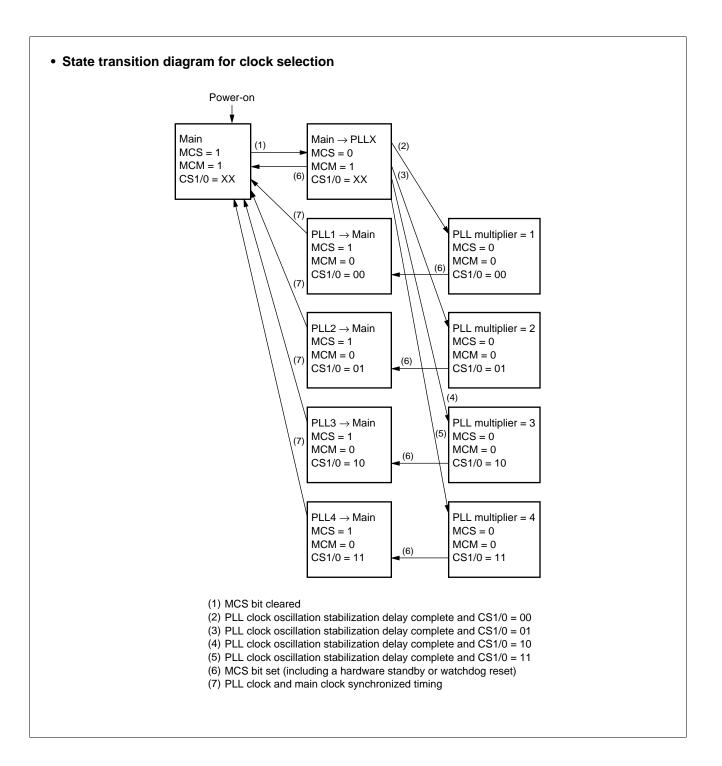

· Clock select register

R/W: Readable and writable

R : Read only W : Write only

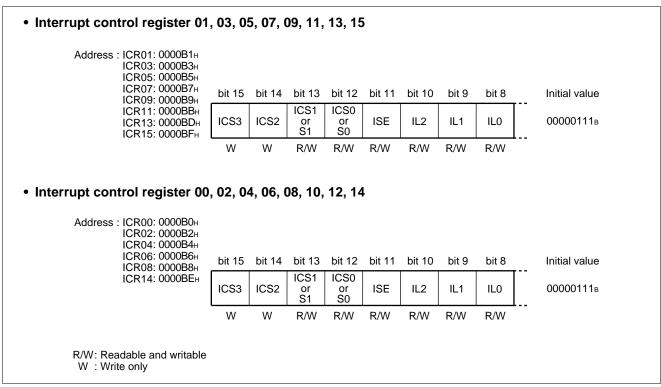

#### 11. Interrupt Controller

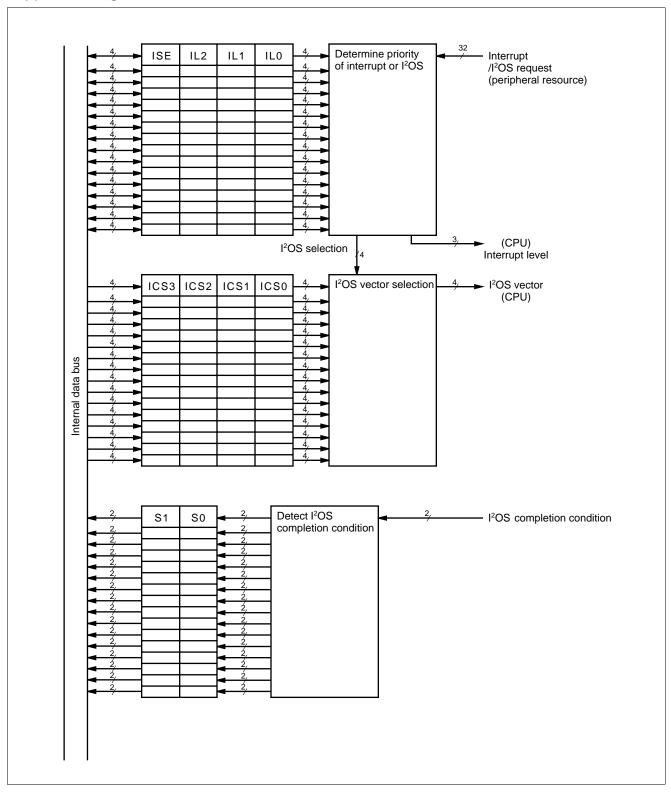

The interrupt control registers are located in the interrupt controller. An interrupt control register is provided for each I/O with an interrupt function. The registers have the following three functions.

- Set the interrupt level of the corresponding peripheral.
- Select whether to treat interrupts from the corresponding peripheral as standard interrupts or activate the extended intelligent I/O service.
- Select the extended intelligent I/O service channel.

#### (1) Register Configuration

Note: Do not access these registers using read-modify-write instructions as this can cause misoperation.

#### 12. External Bus Terminal Control Circuit

This circuit controls the external bus terminals intended to extend outwardly the CPU's address/data bus.

#### (1) Register Configuration

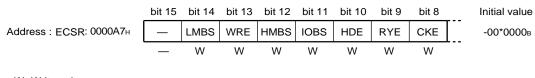

· Register for control of external address output

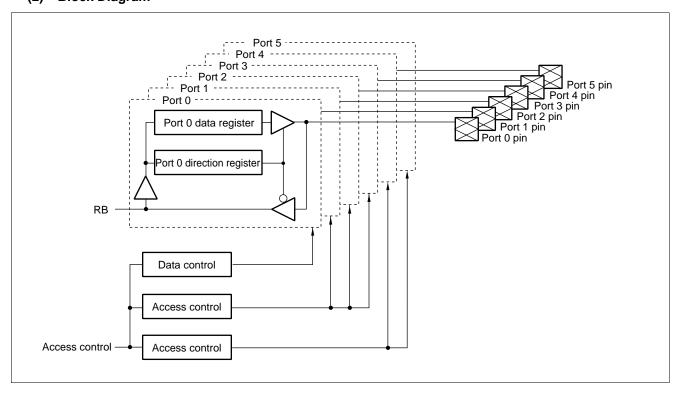

· Register for selection of bus control signal

W: Write only —: Unused

X : Indeterminate

\*: "1" or "0" (determined owing to the MD0 to MD2 pin level)

#### **■ ELECTRICAL CHARACTERISTICS**

L level input voltage	VILS	Vss - 0.3	0.2 Vcc	V	Hysteresis input pins*
	VILM	Vss - 0.3	Vss + 0.3	V	MD input pin
Smoothing capacitor	Cs	0.1	1.0	μF	Use the ceramic capacitor or the capacitor which has the similar frequency characteristic as ceramic capacitor. When attach the smoothing capacitor to Vcc, use the capacitor whose capacitance is larger than Cs.
Operating temperature	TA	-40	+85	°C	

<sup>\*:</sup> Target pins are P60 to P67, P71 to P76, P80 to P86, P90 to P95, HST, and RST. (When used as general purpose pins)

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

### 3. DC Characteristics

### ■ INSTRUCTIONS (340 INSTRUCTIONS)

Table 1 Explanation of Items in Tables of Instructions

Item	Meaning
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler.  Lower-case letters: Replaced when described in assembler.  Numbers after lower-case letters: Indicate the bit width within the instruction.
#	Indicates the number of bytes.
~	Indicates the number of cycles. m: When branching n: When not branching See Table 4 for details about meanings of other letters in items.
RG	Indicates the number of accesses to the register during execution of the instruction. It is used calculate a correction value for intermittent operation of CPU.
В	Indicates the correction value for calculating the number of actual cycles during execution of the instruction. (Table 5)  The number of actual cycles during execution of the instruction is the correction value summed with the value in the "~" column.
Operation	Indicates the operation of instruction.
LH	Indicates special operations involving the upper 8 bits of the lower 16 bits of the accumulator.  Z: Transfers "0".  X: Extends with a sign before transferring.  -: Transfers nothing.
АН	Indicates special operations involving the upper 16 bits in the accumulator.  * : Transfers from AL to AH.  - : No transfer.  Z : Transfers 00H to AH.  X : Transfers 00H or FFH to AH by signing and extending AL.
I	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky bit),
S	N (negative), Z (zero), V (overflow), and C (carry).  * : Changes due to execution of instruction.
Т	- : No change.
N	S: Set by execution of instruction.  R: Reset by execution of instruction.
Z	
V	
С	
RMW	Indicates whether the instruction is a read-modify-write instruction. (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.)  * : Instruction is a read-modify-write instruction.  — : Instruction is not a read-modify-write instruction.  Note: A read-modify-write instruction cannot be used on addresses that have different meanings depending on whether they are read or written.

 Table 2
 Explanation of Symbols in Tables of Instructions

Symbol	Meaning
A	32-bit accumulator The bit length varies according to the instruction. Byte: Lower 8 bits of AL Word: 16 bits of AL Long: 32 bits of AL:AH
AH AL	Upper 16 bits of A Lower 16 bits of A
SP	Stack pointer (USP or SSP)
PC	Program counter
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB, SPB
brg2	DTB, ADB, SSB, USB, DPR, SPB
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir	Compact direct addressing
addr16 addr24 ad24 0 to 15 ad24 16 to 23	Direct addressing Physical direct addressing Bit 0 to bit 15 of addr24 Bit 16 to bit 23 of addr24
io	I/O area (000000н to 0000FFн)
imm4 imm8 imm16 imm32 ext (imm8)	4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data signed and extended from 8-bit immediate data
disp8 disp16	8-bit displacement 16-bit displacement
bp	Bit offset
vct4 vct8	Vector number (0 to 15) Vector number (0 to 255)
( )b	Bit address

(Continued)

#### (Continued)

Symbol	Meaning
rel	Branch specification relative to PC
ear eam	Effective addressing (codes 00 to 07) Effective addressing (codes 08 to 1F)
rlst	Register list

Table 3 Effective Address Fields

Code	No	tation	l	Address format	Number of bytes in address extension *
00 01 02 03 04 05 06 07	R1 F R2 F R3 F R4 F R5 F R6 F	RW0 RW1 RW2 RW3 RW4 RW5 RW6 RW7	RL0 (RL0) RL1 (RL1) RL2 (RL2) RL3 (RL3)	Register direct  "ea" corresponds to byte, word, and long-word types, starting from the left	_
08 09 0A 0B	@RW0 @RW1 @RW2 @RW3	1 2		Register indirect	0
0C 0D 0E 0F	@RW0 @RW1 @RW2 @RW3	1 + 2 +		Register indirect with post-increment	0
10 11 12 13 14 15 16 17	@ RW0 @ RW1 @ RW2 @ RW3 @ RW4 @ RW5 @ RW5	1 + dis 2 + dis 3 + dis 4 + dis 5 + dis 6 + dis	.p8 p8 p8 p8 p8 p8 p8	Register indirect with 8-bit displacement	1
18 19 1A 1B	@RW( @RW1 @RW2 @RW3	1 + dis 2 + dis	p16 p16	Register indirect with 16-bit displacement	2
1C 1D 1E 1F	@RW0 @RW1 @PC - addr16	1 + RW + disp1	<i>1</i> 7	Register indirect with index Register indirect with index PC indirect with 16-bit displacement Direct address	0 0 2 2

Note: The number of bytes in the address extension is indicated by the "+" symbol in the "#" (number of bytes) column in the tables of instructions.

Table 4 Number of Execution Cycles for Each Type of Addressing

		(a)	Number of register
Code	Operand	Number of execution cycles for each type of addressing	accesses for each type of addressing
00 to 07	Ri RWi RLi	Listed in tables of instructions	Listed in tables of instructions
08 to 0B	@RWj	2	1
0C to 0F	@RWj +	4	2
10 to 17	@RWi + disp8	2	1
18 to 1B	@RWj + disp16	2	1
1C	@RW0 + RW7	4	2
1D 1E	@RW1 + RW7 @PC + disp16	4	2
1F	addr16	1	0

Note: "(a)" is used in the "~" (number of states) column and column B (correction value) in the tables of instructions.

Table 5 Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles

	(b)	byte	(c) v	vord	(d) I	ong
Operand	Number of cycles	Number of access	Number of cycles	Number of access	Number of cycles	Number of access
Internal register	+0	1	+0	1	+0	2
Internal memory even address Internal memory odd address	+0 +0	1 1	+0 +2	1 2	+0 +4	2 4
Even address on external data bus (16 bits) Odd address on external data bus (16 bits)	+1 +1	1 1	+1 +4	1 2	+2 +8	2 4
External data bus (8 bits)	+1	1	+4	2	+8	4

Notes: • "(b)", "(c)", and "(d)" are used in the "~" (number of states) column and column B (correction value) in the tables of instructions.

• When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

Table 6 Correction Values for Number of Cycles Used to Calculate Number of Program Fetch Cycles

Instruction	Byte boundary	Word boundary
Internal memory	_	+2
External data bus (16 bits)	_	+3
External data bus (8 bits)	+3	_

Notes: • When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

• Because instruction execution is not slowed down by all program fetches in actuality, these correction values should be used for "worst case" calculations.

© FUJITSU LIMITED Printed in Japan

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
