DESCRIPTION:

This octal bus transceiver is built using advanced dual metal CMOS technology. The three-state controls are designed to operate this device in a single-byte mode. All inputs are designed with hysteresis for improved noise margin.

The ALVCH245 is designed for asynchronous communication between data buses. The device transmits data from the A bus to the B bus or from the B bus to the A bus, depending on the logic level at the direction-control (DIR) input.

The ALVCH245 has been designed with a $\pm 24mA$ output driver. This driver is capable of driving a moderate to heavy load while maintaining speed performance.

The ALVCH245 has "bus-hold" which retains the inputs' last state whenever the input bus goes to a high impedance. This prevents floating inputs and eliminates the need for pull-up/down resistors.
