### Drive Features for LVC244A:

- High Output Drivers: ±24mA
- Reduced system switching noise

## **APPLICATIONS:**

- 5V and 3.3V mixed voltage systems
- Data communication and telecommunication systems

### **DESCRIPTION:**

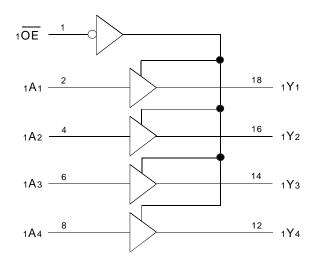

The LVC244A device is organized as two 4-bit line drivers with separate output-enable  $(\overline{OE})$  inputs. When  $\overline{OE}$  is low, the device passes data from the A inputs to the Y outputs. When  $\overline{OE}$  is high, the outputs are in the high-impedance state.

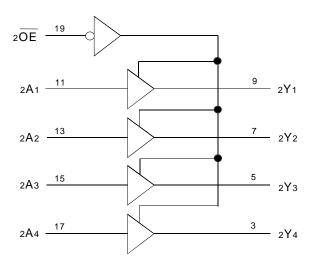

The LVC244A has been designed with a  $\pm 24$ mA output driver. This driver is capable of driving a moderate to heavy load while maintaining speed performance.

To ensure the high-impedance state during power up or power down,  $\overline{\text{OE}}$  should be tied to VCC through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Inputs can be driven from either 3.3 V or 5 V devices. This feature allows the use of this device as a translator in a mixed 3.3 V/5 V system environment.
