### Description

The PDM31532 is a high-performance CMOS static RAM organized as 65,536 x 16 bits. The PDM31532 features low power dissipation using chip enable ( $\overline{CE}$ ) and has an output enable input ( $\overline{OE}$ ) for fast memory access. Byte access is supported by upper and lower byte controls.

The PDM31532 operates from a single 3.3V power supply and all inputs and outputs are fully TTL-compatible.

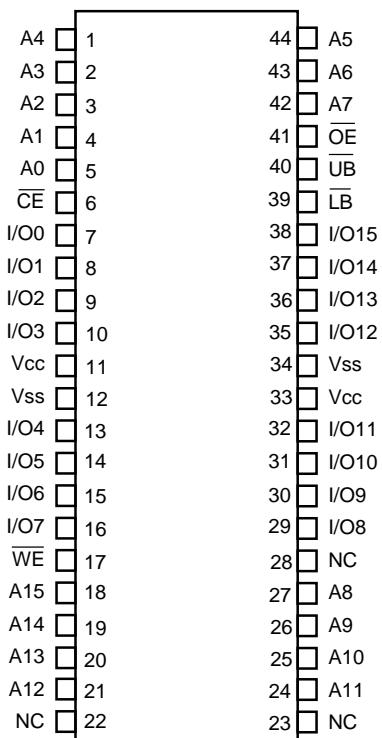

The PDM31532 is available in a 44-pin 400 mil plastic SOJ and a plastic TSOP (II) package for high-density surface assembly and is suitable for use in high-speed applications requiring high-speed storage.

This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
3. Appropriate thermal calculations should be performed in all cases and specifically for those where the chosen package has a large thermal resistance (e.g., TSOP). The calculation should be of the form: T<sub>j</sub> = T<sub>a</sub> + P \* θ<sub>ja</sub> where T<sub>a</sub> is the ambient temperature, P is average operating power and θ<sub>ja</sub> the thermal resistance of the package. For this product, use the following θ<sub>ja</sub> values:

SOJ: 59° C/W

TSOP: 87° C/W

## Notes for AC Tables

- NOTES:**
- 5. Measured with  $C_L = 5 \text{ pF}$  as in Figure 2. Transition is measured  $\pm 200 \text{ mV}$  from steady state voltage
  - 6. At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$  and  $t_{HZWE}$  is less than  $t_{LZWE}$ .
  - 7.  $V_{cc} = 3.3V \pm 5\%$
  - 8. If  $\overline{OE}$  is HIGH during a write cycle, the outputs are in a high-impedance state during this period.
  - 9. If the  $\overline{CE}$  LOW transition occurs coincident with or after the  $\overline{WE}$  LOW transition, outputs remain in a high impedance state
  - 10. If the  $\overline{CE}$  HIGH transition occurs coincident with or after the  $\overline{WE}$  HIGH transition, outputs remain in a high impedance state.
