

LOW-POWER LOW-OFFSET-VOLTAGE TINY C-MOS SINGLE OPERATIONAL AMPLIFIER

■ GENERAL DESCRIPTION

The NJU7091A, 92A and 93A are single C-MOS operational amplifier operated on a single-power-supply, low voltage and low operating current.

The input offset voltage is lower than 2mV.

The minimum operating voltage is 1V and the output stage permits output signals to swing between both of the supply rails.

The input bias current is as low as less than 1pA, consequently the very small signal around the ground level can be amplified.

Furthermore, this series is packaged with very small MTP-5, therefore it can be especially applied to portable items.

Note1) If the supply voltage (V_{DD}) is less than 6.5V, the input voltage must not over the V_{DD} level though 6.5V is limit specified.

Note2) Decoupling capacitor should be connected between V_{DD} and V_{SS} due to the stabilized operation for the circuit.
