CMOS 10-Bit A/D Converter with Track-and-Hold

MAX177

General Description

The MAX177 is a complete CMOS sampling 10-bit analog-to-digital converter (ADC) that combines an on-chip track-and-hold and voltage reference along with high conversion speed and low power consumption. A conversion time of 8.33 μ s includes settling time for the track-and-hold. An internal buried zener reference provides low drift with low noise.

The MAX177 accepts -2.5V to +2.5V inputs. External components are limited to only decoupling capacitors for the power supply and reference voltages. On-chip clock circuitry can either be driven from an external clock source or a crystal.

The MAX177 employs a standard microprocessor interface. Three-state data outputs can be configured for 8- or 12-bit data buses. Data access and bus release timing specs are compatible with most popular microprocessors without resorting to wait states.

Note 5: V_{REF} Tempco = dV_{REF}/dT, where dV_{REF} is reference voltage change from T_A = 25°C to T_{MIN} T_{MAX}.

Note 6: All input control signals are specified with t_r = t_f = 5ns (10% to 90% of +5V) and timed from a voltage level of +1.6V.

Note 7: This specification is 100% production tested.

Note 8: t₃ and t₆ are measured with the load circuits of Figure 1 and defined as the time required for an output to cross 0.8V or 2.4V.
