## Dispatch Table

## CR16A Instruction Set

Mnemonic	Operands	Description	Flag
Load and Store			
LOADi	disp(Rbase), Rdest	Load (register relative)	
	disp(Rpair+1, Rpair), Rdest	Load (far-relative)	
	abs, Rdest	Load (absolute)	
STORi	Rsrc, disp(Rbase)	Store (register relative)	
	Rsrc, disp(Rpair +1, Rpair)	Store (far-relative)	
	Rsrc, abs	Store (absolute)	
Moves			
MOVi	Rsrc/imm, Rdest	Move	
MOVXB	Rsrc, Rdest	Move with sign extension	
MOVZB	Rsrc, Rdest	Move with zero extension	
Integer Arithmetic			
ADDi	Rsrc/imm, Rdest	Add	CF
ADDUi	Rsrc/imm, Rdest	Add	
ADDCi	Rsrc/imm, Rdest	Add with carry	CF
MULi	Rsrc/imm, Rdest	Multiply	
SUBi	Rsrc/imm, Rdest	Subtract (Rdest := Rdest – Rsrc)	CF
SUBCi	Rsrc/imm, Rdest	Subtract with carry (Rdest := Rdest – Rsrc – PSR.C)	CF
Integer Comparison			
CMPi	Rsrc/imm, Rdest	Compare (Rdest – Rsrc)	ZNL
Logical and Boolean			
ANDi	Rsrc/imm, Rdest	Logical AND	
ORi	Rsrc/imm, Rdest	Logical OR	
Scond	Rdest	Save condition code as boolean	
XORi	Rsrc/imm, Rdest	Logical exclusive OR	
Shifts			
ASHUi	Rsrc/imm, Rdest	Arithmetic left/right shift	
LSHi	Rsrc/imm, Rdest	Logical left/right shift	
Bits			
TBIT	Roffset/imm, Rsrc	Test bit	F
Processor Control			
DI		Disable maskable interrupts	E
EI		Enable maskable interrupts	E
LPR	Rsrc, Rproc	Load processor register	CTLFZNEPI
SPR	Rproc, Rdest	Store processor register	

### CR16A Instruction Set (Continued)

Mnemonic	Operands	Description	Flag
Jumps and Linkage			
Bcond	disp	Conditional branch	
BAL	Rlink, disp	Branch and link	
BR	disp	Branch	
EXCP	vector	Trap (vector)	
Jcond	Rtarget	Conditional Jump	
JAL	Rlink, Rtarget	Jump and link	
JUMP	Rtarget	Jump	
RETX		Return from exception	
Miscellaneous			
NOP		No operation	
WAIT		Wait for interrupt	

### Glossary for CR16A Instruction Set

abs	Absolute address
disp16	16-bit displacement
imm	Immediate value
Rbase	Base register. Any general-purpose register (R0 - R13, RA, SP), holding the base address of a memory variable
Rdest	Destination Register. Any general-purpose register (R0 - R13, RA, SP)
disp (Rbase)	Relative addressing; Address = disp + (Rbase)
Rlink	Link Register. Any general-purpose register (R0 - R13, RA, SP), holding the address of the next sequential instruction, used as a return address
Roffset	Bit position, stored in any general-purpose register (R0 - R13, RA, SP)
Rproc	Processor registers (PC, PSR, ISP)
Rsrc	Source Register. Any general-purpose register (R0 - R13, RA, SP)
Rtarget	Target Register. Any general-purpose register (R0 - R13, RA, SP), holding the JUMP/JAL target address

## Compiler Flags

Flag	Description
<code>@optfile</code>	Read command line arguments from <i>optfile</i> .
<code>-g</code>	Generate symbolic information for debugging the source code.
<code>-c</code>	Compile but do not link (do not invoke the linker automatically).
<code>-S</code>	Generate assembly code only.
<code>-n</code>	Embed C source lines as comment in assembly.
<code>-o filename</code>	Direct the output to a file.
<code>-llibrary</code>	Specify a standard library for the linker.
<code>-O</code>	Optimization - prefer speed over space.
<code>-Os</code>	Optimization - prefer space over speed.
<code>-srel</code>	Special space optimization - use the efficient static base relative access mode for selected variables. R12 is used as the base register. The total size of these variables is limited to 32 bytes. Use <code>#pragma srel(var)</code> to select these variables.
<code>-fshort-enums</code>	Optimize size of enumeration type
<code>-oi</code>	Optimize, but treat all global variables as volatile.
<code>-ON</code>	Optimization - perform loop unrolling in addition to the default speed optimization.
<code>-ffixed-REG</code>	Do not use register ( <i>REG</i> ). e.g., <code>-ffixed-r8</code> : does not use r8.
<code>-KFemulation</code>	Link the application with the floating-point emulation library.
<code>-finline-functions</code>	Integrate all simple functions into their callers.
<code>-KBwidth</code>	Set target buswidth. Guide the compiler to align all stack variables in the most efficient manner for a given bus width. <i>width</i> = 1, 2, 4.
<code>-Jbytes</code>	Align the members of all structures as specified by <i>bytes</i> : <i>bytes</i> = 1, 2, 4.
<code>-Wimplicit</code>	Warn about functions with missing prototype declaration.
<code>-ansi</code>	Accept strict ANSI C programs only.
<code>-w</code>	No warning diagnostics.
<code>-Q</code>	Error checking only.
<code>-v</code>	Verbose mode (show compilation stages).
<code>-vn</code>	Verbose mode without actually executing.
<code>-z</code>	Dump errors and warnings into <file>.err.
<code>-znfilename</code>	Dump errors and warnings into <i>filename</i> .
<code>-E</code>	Run cpp only, direct output to stout
<code>-P</code>	Run cpp only, direct output to <file>.i
<code>-Idir</code>	Specify directory for include files.
<code>-Dsymbol[=def]</code>	Define cpp symbol, which can be assigned to a specific value. Equivalent to <code>#define symbol def</code> .
<code>-Usymbol</code>	Remove initial definition of symbol. Equivalent to <code>#undef symbol</code> .

### Examples of Compiler Invocation Lines

Invocation Line	Description	Output
crcc file.c -g	Compile and produce symbolic debugging information. Invoke the linker using the default libraries.	cr.x
crcc file1.c file2.c -g	Compile file1.c and file2.c; produce symbolic debugging information for each file. Invoke the linker using the default libraries.	cr.x
crcc file.c -g -c	Compile only; produce symbolic debugging information.	file.o
crcc file1.c file2.c -g -c	Compile file1.c and file2.c; produce symbolic debugging information for each file.	file1.o file2.o
crcc file.c -S	Compile, but do not assemble; generate assembly code only.	file.s
crcc file.c -S -n	Compile, but do not assemble; generate assembly code which is annotated by the C source lines.	file.s
crcc file.c -KFemulation	Compile and link with the floating point emulation library.	cr.x
crcc file.c -g -c -O	Compile and optimize the code for speed. Generate debugging symbolic information.	file.o
crcc file.c -g -c -Os	Compile and optimize the code for space. Generate debugging symbolic information.	file.o
crcc file.c -g -c -Os -sbase	Compile and optimize the code for space. Use the static base relative access mode. Produce debugging symbolic information.	file.o
crcc file.c -g -c -Idir	Compile and produce symbolic debugging information. Look for the include files in the dir directory.	file.o
crcc file.c -g -c -Ddef1	Compile and produce symbolic debugging information. Define a preprocessor symbol called def1.	file.o
crcc file.c -g -o file.x	Compile, link and produce symbolic debugging information. The executable file is called file.x.	file.x
crcc file.s	Assemble and link the assembly file.	cr.x
crcc file1.s file2.c	Assemble file1.s, compile file2.c and link the two generated object files with the default libraries.	cr.x
crcc file1.s file2.c file3.o	Assemble file1.s, compile file2.c and link the two generated object files and file3.o with the default libraries.	cr.x

### Libraries used by the Compiler

Libraries used by default	libstart, libc, libd
Libraries used when Floating-Point emulation is required (i.e., when -KFemulation command line option is used)	libstart, libc, libhfp

## Assembler Flags

Flag	Description
<code>-g</code>	Produce line number information for symbolic debugging.
<code>-L[filename]</code>	Produce listing information. Listing is redirected to <i>filename</i> , if specified, or to the standard output, if not.
<code>-MO</code>	Invoke only macro-processing phase.
<code>-MP[filename]</code>	Print the macro processing output. Output is redirected to <i>filename</i> , if specified, or to the standard output, if not.
<code>-Dname[=def]</code>	Define cpp symbol, which can be assigned to a specific value. Equivalent to <code>#define name def</code> .
<code>-Uname</code>	Remove initial definition of a predefined name. Equivalent to <code>#undef name</code> .
<code>-o objectfile</code>	Name the output object file, <i>objectfile</i> .
<code>-w</code>	Suppress assembly warning messages.
<code>-c</code>	Run the C compiler pre-processor (cpp). The cpp output is the input of the assembler.
<code>-Idir</code>	Search for the include files in the <i>dir</i> directory. The <code>-c</code> option must precede this option.
<code>-n</code>	Disable displacement size optimization.
<code>@optfile</code>	Read input for the invocation line from <i>optfile</i> . This includes linker flags as well as files/library list.
<code>-z</code>	Dump errors and warnings into <file>.err.
<code>-znfilename</code>	Dump errors and warnings into <i>filename</i> .

## Examples of Assembler Invocation Lines

Invocation Line	Description	Output
<code>crasm file.s</code>	Assemble the file.	<code>file.o</code>
<code>crasm file.s -g</code>	Assemble the file; add line number information for symbolic debugging.	<code>file.o</code>
<code>crasm file.s -Lfile.lis</code>	Assemble the file; generate a listing file.	<code>file.o file.lis</code>
<code>crasm file.s -MO -MP file.mac</code>	Invoke macro-processing only, and direct the output to <code>file.mac</code> .	<code>file.mac</code>
<code>crasm file.s -Idir -g -c</code>	Assemble the file; add line number information for debugging. Look for include files in the <i>dir</i> directory.	<code>file.o</code>

## Linker Flags

Flag	Description
<b>-m</b>	Generate a map file.
<b>-d filename</b>	Link the application using a linker directive file, <i>filename</i> .
<b>-lx</b>	Add the standard library, <i>libx.a</i> to the list of input libraries.
<b>-Ldir</b>	Search for standard libraries in <i>dir</i> directory.
<b>-e symbol</b>	Specify the program entry point symbol (default: <i>start</i> ).
<b>@optfile</b>	Read input for the invocation line from <i>optfile</i> . This includes linker flags as well as files/library list.
<b>-o filename</b>	Direct the linking output (CompactRISC executable file) to a file, <i>filename</i> .
<b>-f fill_value</b>	Fill output section gaps with <i>fill_value</i> .
<b>-z</b>	Dump errors and warnings into <file>.err.
<b>-znfilename</b>	Dump errors and warnings into <i>filename</i> .

## Examples of Linker Invocation Lines

Invocation Line	Description	Output
crlink file1.o file2.o -ladb -lc -ld	Link the objects files with the CompactRISC standard libraries.	cr.x
crlink file1.o file2.o -ladb -lc -ld -o file.x	Link the objects files with the CompactRISC standard libraries. Name the output executable file, <i>file.x</i> .	file.x
crlink file1.o file2.o -ladb -lc -ld -m > map	Link the objects files with the CompactRISC standard libraries. Produce a map file.	cr.x map
crlink file1.o file2.o -ladb -lc -ld -d linker.def	Link the objects files with the CompactRISC standard libraries. Use the specified linker directive file ( <i>linker.def</i> )	cr.x
crlink file1.o file2.o -ladb -lc -lhfp	Link the objects files with libstart, libc, and the floating-point emulation library, libhfp.	cr.x

## Debugger Command Lines

Definition	Syntax
<b>alias</b>	
Define macro	<name> = command
Define substitution macro	<name> = "command \$\$, \$\$"
List macro	<name>
Remove macro	-r [<name>   *]
<b>autocommand</b>	
Define a list of commands to be executed following an execution command such as step, next, reset, go.	<command>
Remove, disable, enable an entry. An entry id is the ordinal number shown in autocommand, without an argument.	[-r   -d   -e]<id>   *
List autocommands	
<b>call</b>	
Call any function of the application. After execution, control returns to the debugger.	<func_name>(arg1,arg2,...,argn)
<b>cd</b>	
Change/display the working directory for creating/reading files.	[<path>]
<b>comm</b>	
Sets the communication channel to communicate with an ADB, or a simulator running on the host platform.	comm [-s] [-s <communication_channel_name>]
<b>core</b>	
Sets the current CPU core	core [CR16A   CR16BL   CR16BS]
<b>debug</b>	
Select an executable file (COFF) to debug	[-x   -n   -xn] <file_name>
<b>debugmode</b>	
Select debugging mode	[-e   -d] [startup   exitcode]
<b>find</b>	
Find a pattern in memory	[-a   -b   -c   -w   -f   -p   -l   -i] <value>, <addr_range>
<b>findsrc</b>	
Find a string in the current source file	[-f   -b   -n] [<string>] [, <file_name>]
<b>go</b>	
Execute the user program	[-c] [<from_addr>][//<end_addr>]
<b>info</b>	
Display debugger information	
<b>input</b>	
Execute command script file	<file_name>

### Debugger Command Lines (Continued)

Definition	Syntax
<b>list</b> List memory	-m [h   o   d] [b   c   w   f   p   l   i] <addr_range>
List source file	<qualified_lineno>
<b>log</b>	
Create a log file or append to an existing one (default = crdb.log)	[ -a ] <file_name>
Disable / enable the log file	[ -d   -e ]
Give the read only / write only attributes	[ -i   -o ]
Expand aliases	[ -f   -u ]
<b>modify</b>	
Modify memory	[ -b   -c   -w   -f   -p   -l ] <address>   <addr_range> [, <value> [, , value]]
Modify string	-a <string_pointer>, <string>
Modify register	%<reg_name>, <value>
<b>next</b>	
Execute the next source line	[ -c   -n ] [<from_addr> // <end_addr> ]
<b>nextins</b>	
Execute the next assembly instruction	[ -c   -n ] [<from_addr> // <end_addr> ]
<b>pause</b>	
Suspend program execution	
<b>quit</b>	
Quit the debugger	
<b>radix</b>	
Set radix for output display	[ 8   10   16 ]
<b>reset</b>	
Reset the application and the target board	
<b>resume</b>	
Resume execution of an application, that was suspended using the pause command	
<b>saveconfig</b>	
Save the current debugger configuration in a file (default crdb.env)	[ <file_name> ]
<b>savestate</b>	
Save the current debugging state (default crdb.ctx)	[ <file_name> ]

cr16a-ALL 10 Wed Jul 15 10:08:52 1998

**set**

Define debugger's variable and function keys      <name> = <string>

Undefine debugger's variable and function keys      -r <name> | \*

Display variables assignment      <name>

**setstate**

Restore debugging state, as saved with savestate command (default crdb.env)      <file\_name>

**softbreak**

Add a hardware breakpoint      [-t] <softbreak\_list> [, <c=<RLexp>>]  
[,<o=<occ\_cnt>>]

Remove, disable, enable a hardware breakpoint      [-r | -d | -e]<%<

cr16a-ALL 11 Wed Jul 15 10:08:52 1998

**sync**

Display the PC corresponding line

**verbose**

Display all the communication data  
between the debugger and the target

**view**

Display data *<expression> [,<print\_specifier>]*

Display register *%<reg\_name> [,<print\_specifier>]*

**watch**

Select a variable to be displayed automatically in the watch variable window *<expression> [,<print\_specifier>]*

Remove, disable, enable selection *[-r | -d | -e] %<id> | \**

**where**

Show the program context, at any point *[-c | -v] [<func\_symbol>[@<symbol>]]*

## Glossary for Debugger Commands

	General	Data Type
<code>\$\$</code>	Macro argument	<code>-a</code> ASCII string
<code>*</code>	All items	<code>-b</code> Byte
<code>-r</code>	Remove an entry point from a list	<code>-c</code>

## Glossary for Debugger Commands (Continued)

Break			
-t	Temporary breakpoint. This breakpoint is deleted after it occurs		
brkaddr_list	List of breakpoints		
c=RExp	Relational or logical expression which must be evaluated as true for the breakpoint condition		
o=occ_cnt	Number of times the address is referenced before execution is interrupted.		
q=qualifier	Type of access (default = A) E - pc-match. Code at this address is executed A - Data at this address is accessed: read or write R - Data at this address is read W - Data at this address is written		
s=size	Number of bytes for which the data break is applicable (default is the data type of the symbol). or the target integer 2 - 16-bits core 4 - 32-bits core		
Comm			
-s	Sets the debugger to communicate with a simulator running on the host platform.		
-s <name>	Sets the debugger to communicate with an ADB using the communication channel, <name>.		
-c	Closes the current communication channel.		
-l	Displays all available communication names.		
-f <name>	Forces DBGCOM to open the communication channel, <name> .		
Debug			
-x	Selects a file, and downloads it without its symbols	-c	Continues execution of source line until the end of program
-n	Selects a file and downloads only its symbol table	-n	Executes x lines (x = command argument: a given number)
findsrc			
-f	Forward search	-k	Key definition
-b	Backward search	srcmode	
-n	Next find in the same direction	-s	Enables source-only display (for C program, C lines only)
go			
-c	The debugger does not stop at breakpoint just update the windows	-m	Enable mixed mode (for C program; C and assembly lines)
modify			
-a	String copy	where	
		-c	Current source line with arguments
		-v	Stack history

### ASCII Character Set

Char	7-bit Hex Number	Char	7-bit Hex Number	Char	7-bit Hex Number	Char	7-bit Hex Number
