

# SYNC separator IC with AFC BA7062F

The BA7062F separates the synchronization signals from a video signal and outputs the horizontal and vertical synchronization signals ( $H_D$  and  $V_D$ ), and the composite synchronization signal (Sync-out).

The  $H_D$  and  $V_D$  pulse widths are different.

## ● Applications

TVs and VCRs

## ● Features

- 1) Built-in AFC circuit.
- 2) Low power dissipation (approx. 21mW).
- 3) Low external parts count.
- 4) SOP 8-pin package.
- 5) Horizontal free-run frequency does not require adjustment.

## ● Absolute maximum ratings ( $T_a = 25^\circ\text{C}$ )

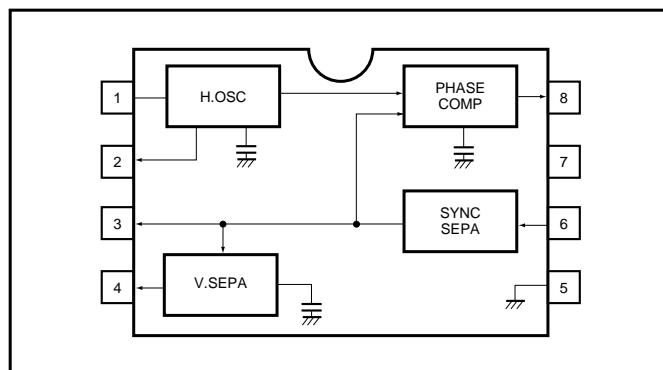

Parameter	Symbol	Limits	Unit
Power supply voltage	$V_{CC}$ Max.	8.0	V
Power dissipation	$P_d$	350*	mW
Operating temperature	$T_{OPR}$	$-20 \sim +75$	$^\circ\text{C}$
Storage temperature	$T_{STG}$	$-55 \sim +125$	$^\circ\text{C}$

\* When mounted on a 50mm × 50mm PCB, reduced by 3.5mW for each increase in  $T_a$  of  $1^\circ\text{C}$  over  $25^\circ\text{C}$ .

## ● Recommended operating conditions ( $T_a = 25^\circ\text{C}$ )

Parameter	Symbol	Min.	Typ.	Max.	Unit
Operating power supply voltage	$V_{CC}$	4.5	—	5.5	V

### ● Circuit operation

#### (1) Synchronization separation circuit

Detects the charging current to a externally-connected capacitor, and performs synchronization separation.

#### (2) Horizontal oscillation circuit

When a video signal is input, it is synchronized with Hsync by the PLL. The horizontal free-running frequency is determined by external resistor R<sub>1</sub>.

$$f_{H-O} = \frac{2.05E6}{R_1} \text{ [kHz]}$$

#### (3) Vertical synchronization separation circuit

When a video signal is input, synchronization signal separation is done over the vertical synchronization pulse interval.

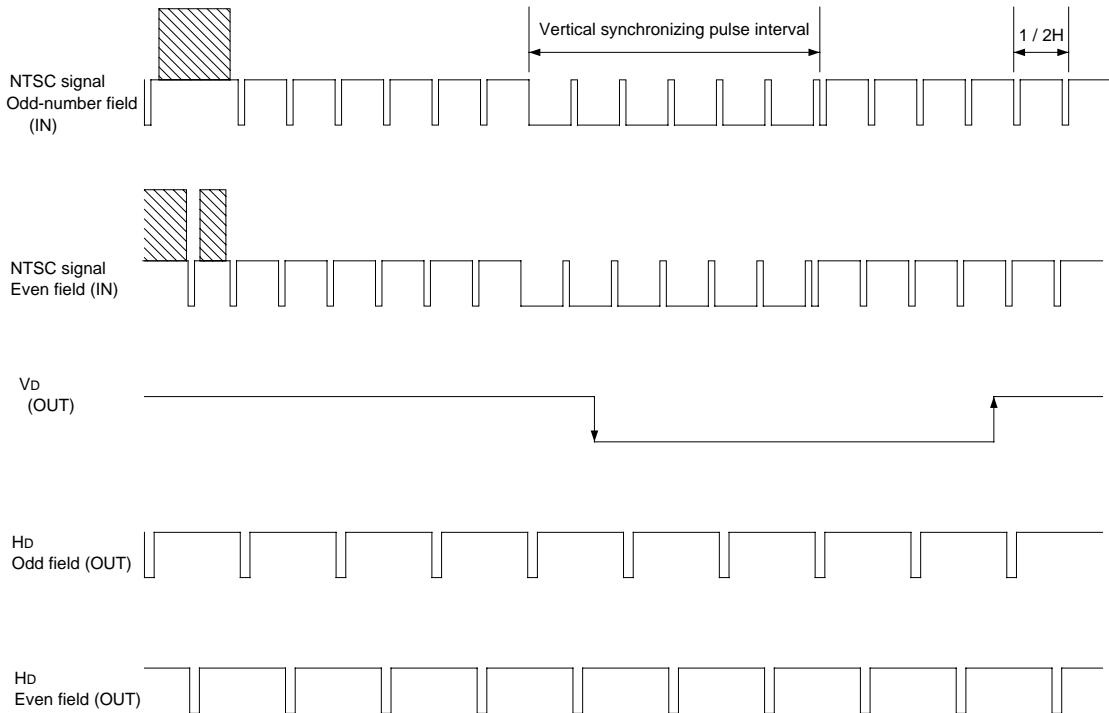

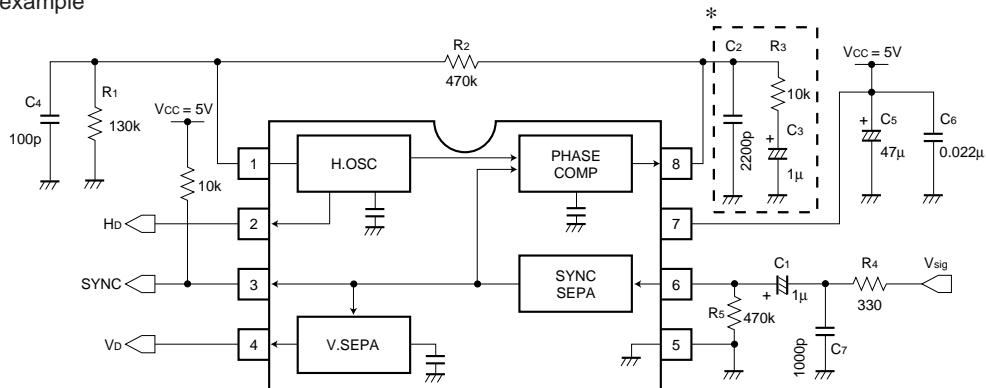

Fig. 8

- (1) The rise and fall positions for  $V_D$  are basically the same for both odd and even fields.
- (2)  $H_D$  shifts by  $1/2H$  during the odd and even field interval.

● Application example

\* By configuring the circuit enclosed in the dotted line to that in the diagram on the right, you can decrease the lock-in time and increase the capture range.

- (1) Connect pin 1 to GND via a 120kΩ (approx.) resistor. Leave pins 2, 4 and 8 open.
- (2) SYNC output polarity (pin 3) is positive.
- (3) The delay time for rising edge of the SYNC output (pin 3) with respect to the falling edge of Sync for the Vsig input signal (pin 6) is 850ns (reference value).
- (4) The delay time for falling edge of the SYNC output (pin 3) with respect to the rising edge of Sync for the Vsig input signal (pin 6) is 450ns (reference value).

● Attached components

Resistor R1 should have a tolerance of  $\pm 2\%$ , and a temperature coefficient of 100ppm or lower.

● Operation notes

- Make the ground line as thick as possible.
- Keep power supply noise to a minimum.
