● Measurement circuit

Note: Certain crystal resonators may require setting XTALI and XTALO to the optimum allowable values.

● Application example

Note: Certain crystal resonators may require setting XTALI and XTALO to the optimum allowable values.

* This IC should be used mounted on a PC board. If mounted in a socket, characteristics of the IC may be adversely affected.

●Attached components

- R1: To keep the voltage of AvDD effectively low, and to enhance signal stability by separating AvDD and DVDD with an impedance. Be sure to attach.
- R2: Needed to provide a feedback resistance for the crystal resonator
- C1 / C2: When f_0 must be adjusted according to the crystal resonator used, or when the crystal resonator results in unnecessary oscillation points, attach a PF and adjust according to the value for this capacitor.
- X1: Use a crystal resonator with an oscillation frequency of 13.5 MHz or 14.318 MHz.
