### DESCRIPTION

The LVQ574 is a low voltage CMOS OCTAL D-TYPE FLIP FLOP with 3 STATE OUTPUTS NON INVERTING fabricated with sub-micron silicon gate and double-layer metal wiring C<sup>2</sup>MOS technology. It is ideal for low power and low noise 3.3V applications.

These 8 bit D-Type flip-flops are controlled by a clock input (CK) and an output enable input (OE).

On the positive transition of the clock, the Q outputs will be set to logic state that were setup at the D inputs.

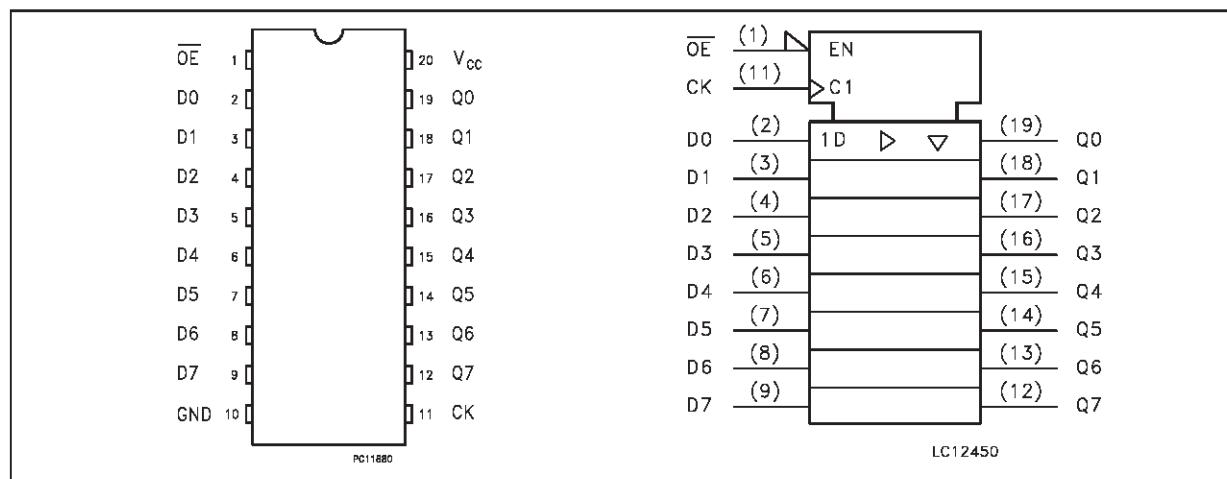

While the (OE) input is low, the 8 outputs will be in a normal logic state (high or low logic level) and while high level, the outputs will be in a high impedance state.

The output control does not affect the internal operation of flip flop, that is, the old data can be retained or the new data can be entered even while the outputs are off.

It has better speed performance at 3.3V than 5V LS-TTL family combined with the true CMOS low power consumption.

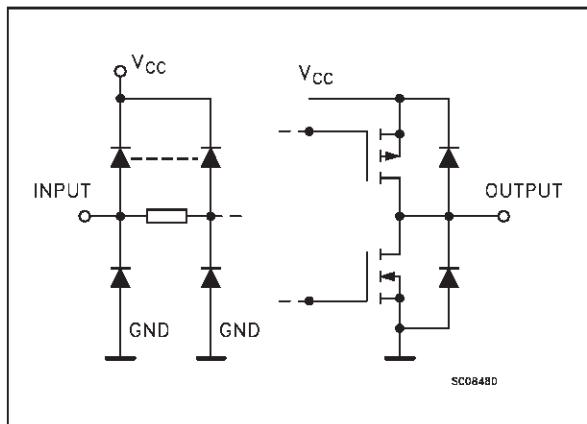

All inputs and outputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.
