DESCRIPTION

The LCX16373 is a low voltage CMOS 16-BIT D-TYPE LATCH with 3 STATE OUTPUTS NON INVERTING fabricated with sub-micron silicon gate and double-layer metal wiring C²MOS technology. It is ideal for low power and high speed 3.3V applications; it can be interfaced to 5V signal environment for both inputs and outputs.

These 16 bit D-Type latches are byte controlled by two latch enable inputs (nLE) and two output enable inputs (OE).

While the nLE input is held at a high level, the nQ outputs will follow the data input precisely.

When the nLE is taken low, the nQ outputs will be latched precisely at the logic level of D input data.

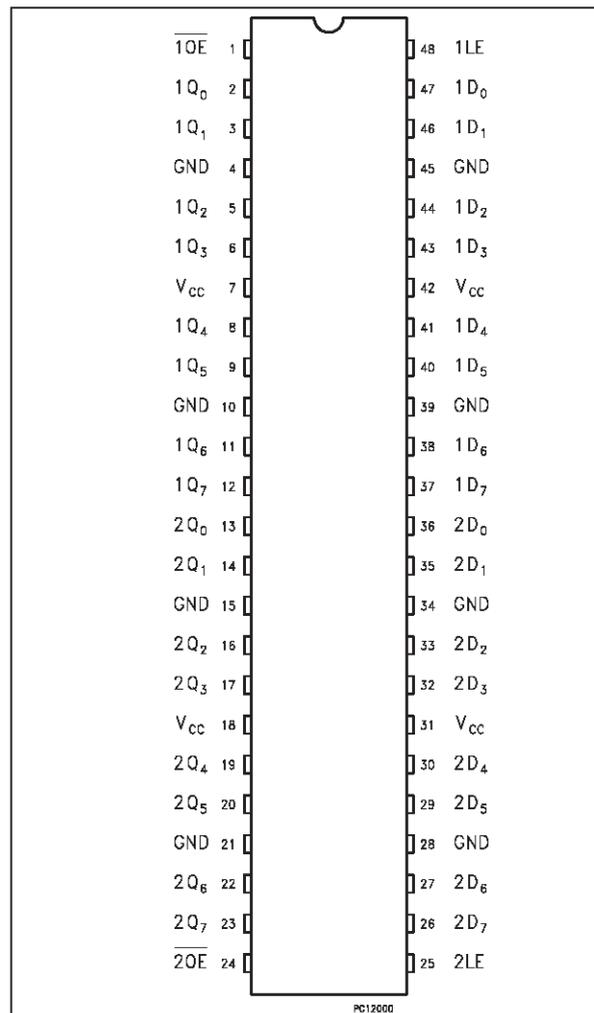

While the (nOE) input is low, the nQ outputs will be in a normal logic state (high or low logic level) and while high level the outputs will be in a high impedance state.

It has better speed performance at 3.3V than 5V LSTTL family combined with the true CMOS low power consumption.

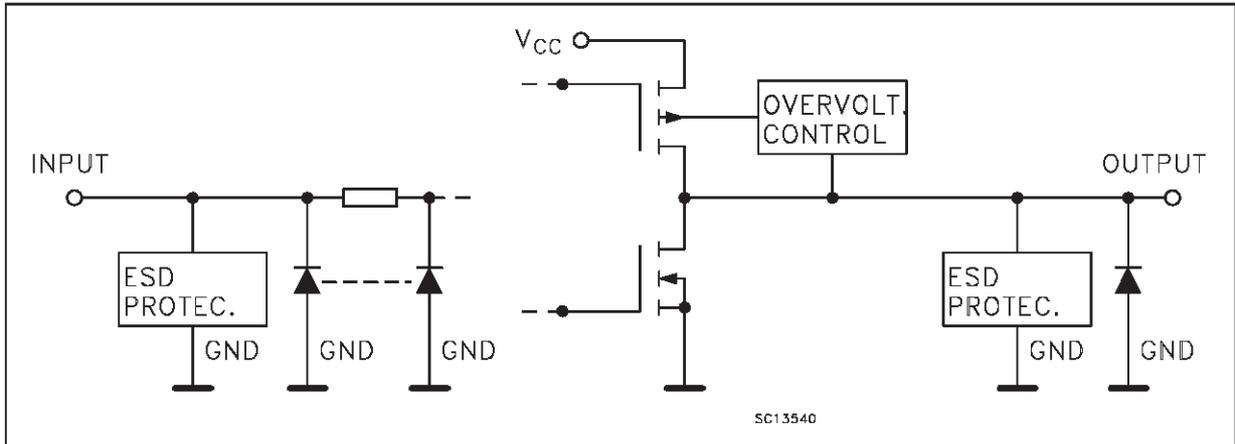

All inputs and outputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.
