DESCRIPTION

The VCX162374 is a low voltage CMOS 16-BIT D-TYPE FLIP FLOP with 3 STATE OUTPUT NON INVERTING fabricated with sub-micron silicon gate and five-layer metal wiring C²MOS technology. It is ideal for low power and very high speed 1.8 to 3.6V applications; it can be interfaced to 3.6V signal environment for both inputs and outputs.

These 16 bit D-Type flip-flops are controlled by two clock inputs (nCK) and two output enable inputs (nOE).

On the positive transition of the (nCK), the nQ outputs will be set to the logic state that were setup at the nD inputs.

While the (nOE) input is low, the 8 outputs (nQ) will be in a normal state (high or low logic level) and while high level the outputs will be in a high impedance state.

Any output control does not affect the internal operation of flip flops; that is, the old data can be retained or the new data can be entered even while the outputs are off.

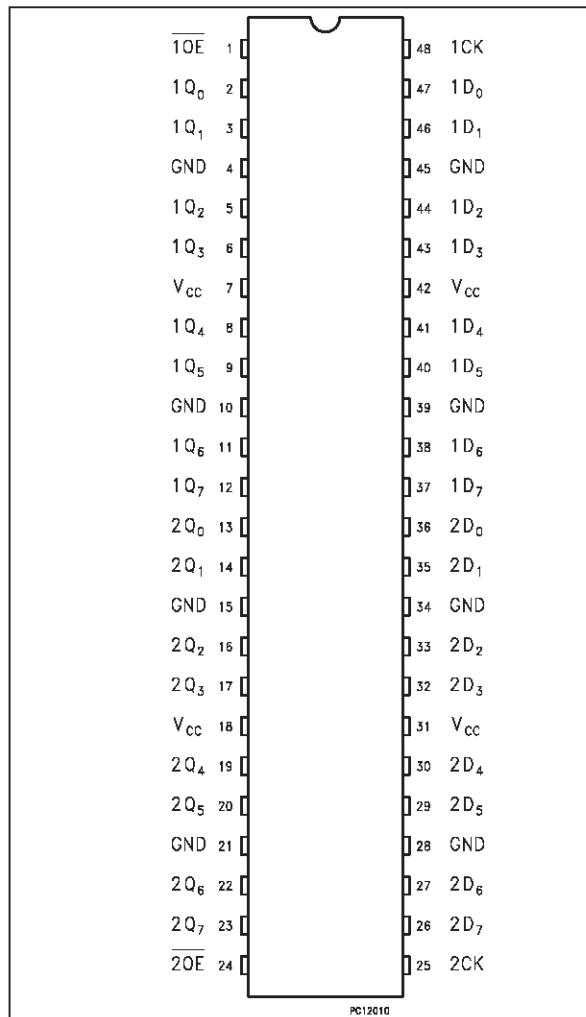

The device circuits is including 26Ω series resistance in the outputs. These resistors permit to reduce line noise in high speed applications.
