### DESCRIPTION

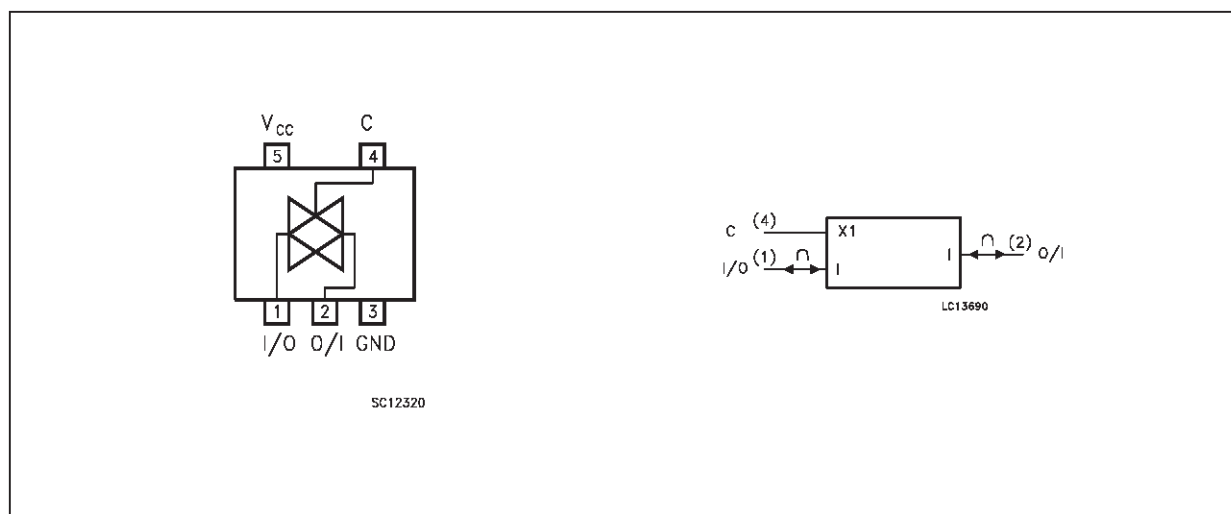

The 74V1G66 is an high-speed CMOS SINGLE BILATERAL SWITCH fabricated in silicon gate C2MOS technology. It achieves high speed propagation delay and VERY LOW ON resistances while maintaining true CMOS low power consumption. This feature makes this part ideal for battery-powered equipment. This bilateral switch handles rail to rail analog and digital signals that may vary across the full power-supply range (from Vcc to Ground).

SC-70		74V1G66C-TR

The C input is provided to control the switch and it's compatible with standard CMOS output; the switch is ON (Port I/O is connected to Port O/I) when the C input is held high and OFF (high-impedance state exists between the two ports) when C is held low. It can be used in many application as Battery Powered System, Audio Signal Routing, Communications System, Test Equipment. It's available in the commercial temperature range in SOT23-5L and SC-70-5L package.
