

LM108AJAN

Operational Amplifiers

General Description

The LM108 is a precision operational amplifier having specifications a factor of ten better than FET amplifiers over a -55°C to $+125^{\circ}\text{C}$ temperature range.

The devices operate with supply voltages from $\pm 2\text{V}$ to $\pm 20\text{V}$ and have sufficient supply rejection to use unregulated supplies. Although the circuit is interchangeable with, and uses the same compensation as the LM101A, an alternate compensation scheme can be used to make it particularly insensitive to power supply noise and to make supply bypass capacitors unnecessary.

The low current error of the LM108 makes possible many designs that are not practical with conventional amplifiers. In

fact, it operates from $10\text{ M}\Omega$ source resistances, introducing less error than devices such as the 709 with $10\text{ k}\Omega$ sources. Integrators with drifts less than $500\text{ }\mu\text{V}/\text{sec}$ and analog time delays in excess of one hour can be made using capacitors no larger than $1\text{ }\mu\text{F}$.

Features

- Maximum input bias current of 3.0 nA over temperature
- Offset current less than 400 pA over temperature
- Supply current of only $300\text{ }\mu\text{A}$, even in saturation
- Guaranteed drift characteristics

Compensation Circuits

Standard Compensation Circuit

20129401

$$C_f \geq \frac{R1 C_O}{R1 + R2}$$

$C_O = 30 \text{ pF}$

**Bandwidth and slew rate are proportional to $1/C_f$

Alternate Frequency Compensation (Note 1)

20129402

**Bandwidth and slew rate are proportional to $1/C_s$

Note 1: Improves rejection of power supply noise by a factor of ten.

AC Parameters

The following conditions apply to all the following parameters, unless otherwise specified.

AC $+V_{CC} = +20V$, $-V_{CC} = -20V$, $V_{CM} = 0V$, $R_S = 50\Omega$

Symbol	Parameter	Conditions	Notes	Min	Max	Units	Sub-groups
TR_{TR}	Transient Response Rise Time	$R_L = 10K\Omega$, $C_L = 100pF$, $f < 1KHz$, $V_I = +50mV$			1000	nS	7, 8A, 8B
TR_{OS}	Transient Response Overshoot	$R_L = 10K\Omega$, $C_L = 100pF$, $f < 1KHz$, $V_I = +50mV$			50	%	7, 8A, 8B
$+SR$	Slew Rate	$A_V = 1$, $V_I = -5V$ to $+5V$		0.05		V/ μS	7, 8A, 8B
$-SR$	Slew Rate	$A_V = 1$, $V_I = +5V$ to $-5V$		0.05		V/ μS	7, 8A, 8B
NI_{BB}	Noise Broadband	$BW = 10Hz$ to $5KHz$, $R_S = 0\Omega$			15	μV_{rms}	7
NI_{PC}	Noise Popcorn	$BW = 10Hz$ to $5KHz$, $R_S = 100K\Omega$			40	μV_{pk}	7

LM108A Electrical Characteristics (Continued)

DC Parameters Drift Values

The following conditions apply to all the following parameters, unless otherwise specified.

DC $+V_{CC} = +20V$, $-V_{CC} = -20V$, $V_{CM} = 0V$, $R_S = 50\Omega$

Delta calculations performed on JAN S devices at group B, Subgroup 5 only.

Symbol	Parameter	Conditions	Notes	Min	Max	Units	Sub-groups
V_{IO}	Input Offset Voltage			-0.25	0.25	mV	1
$\pm I_{IB}$	Input Bias Current			-0.5	0.5	nA	1

Note 2: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 3: The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{Jmax} (maximum junction temperature), θ_{JA} (package junction to ambient thermal resistance), and T_A (ambient temperature). The maximum allowable power dissipation at any temperature is $P_{Dmax} = (T_{Jmax} - T_A) / \theta_{JA}$ or the number given in the Absolute Maximum Ratings, whichever is lower.

Note 4: The inputs are shunted with back-to-back diodes for over voltage protection. Therefore, excessive current will flow if a differential input voltage in excess of 1V is applied between the inputs unless some limiting resistance is used.

Note 5: For supply voltages less than $\pm 20V$, the absolute maximum input voltage is equal to the supply voltage.

Note 6: This rating is $\pm 1.0V$ unless resistances of $2K\Omega$ or greater are inserted in series with the inputs to limit current in the input shunt diodes to the maximum allowable value.

Note 7: Human body model, $1.5 k\Omega$ in series with $100 pF$.

Note 8: Calculated parameter

Note 9: Datalog reading in $K = V/mV$
