## General Description

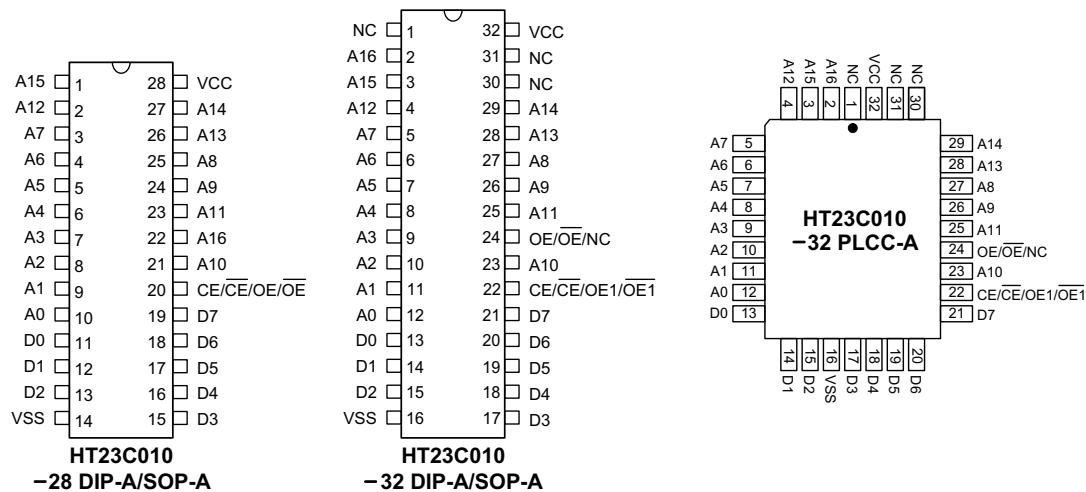

The HT23C010 is a read-only memory with high performance CMOS storage device whose 1024K of memory is arranged into 131072 words by 8 bits.

For application flexibility, the chip enable and output enable control pins can be selected as active high or active low. This flexibility not only allows easy interface with most microprocessors, but also eliminates bus contention in multiple bus microprocessor systems. An additional feature of the HT23C010 is its ability to enter the standby mode whenever the chip enable (CE/ $\overline{CE}$ ) is inactive, thus reducing current consumption to below 30 $\mu$ A. The combination of these functions makes the chip suitable for high density low power memory applications.

## Functional Description

The HT23C010 has two modes, namely data read mode and standby mode, controlled by  $\overline{CE}/\overline{CE}$ / $\overline{OE1}/\overline{OE1}$  and  $\overline{OE}/\overline{OE}/NC$  inputs.

- Standby mode

The HT23C010 offers lower current consumption, controlled by the chip enable input ( $\overline{CE}/\overline{CE}$ ). When a low/high level is applied to the  $\overline{CE}/\overline{CE}$  input regardless of the output enable ( $\overline{OE}/\overline{OE}/NC$ ) states the chip will enter the standby mode.

- Data read mode

When both the chip enable ( $\overline{CE}/\overline{CE}/\overline{OE1}/\overline{OE1}$ ) and the output enable ( $\overline{OE}/\overline{OE}/NC$ ) are active, the chip is in data read mode. Otherwise, active  $\overline{CE}/\overline{CE}$  and inactive  $\overline{OE}/\overline{OE}/NC$  result in deselect mode. The output will remain in Hi-Z state.
