### DESCRIPTION

The 74LVC245A is a low voltage CMOS OCTAL BUS TRANSCEIVER (3-STATE) fabricated with sub-micron silicon gate and double-layer metal wiring C<sup>2</sup>MOS technology. It is ideal for 1.65 to 3.6 V<sub>CC</sub> operations and low power and low noise applications.

This IC is intended for two-way asynchronous communication between data buses and the

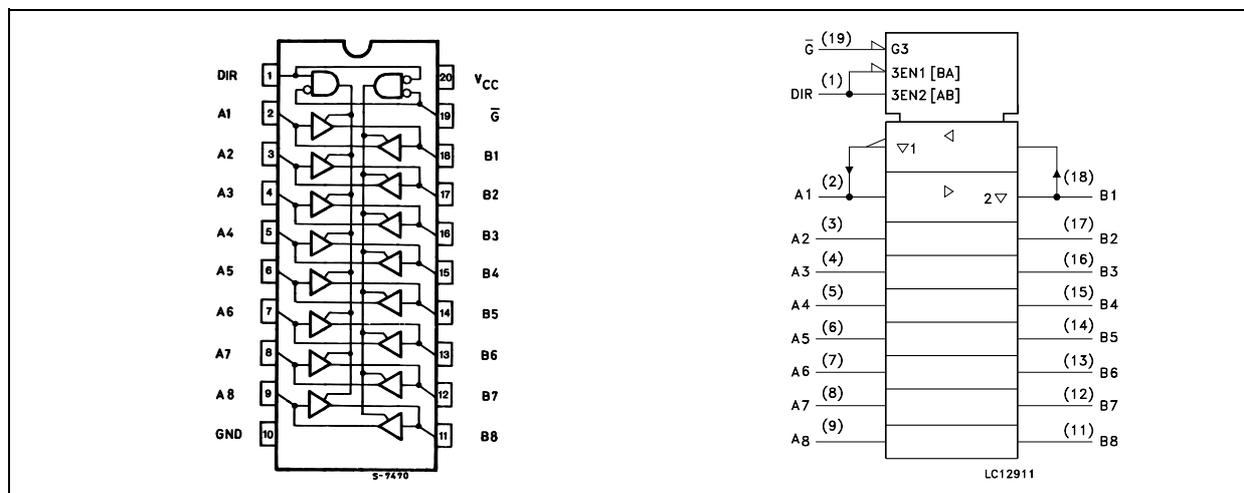

direction of data transmission is determined by DIR input. The enable input  $\bar{G}$  can be used to disable the device so that the buses are effectively isolated.

It has more speed performance at 3.3V than 5V AC/ACT family, combined with a lower power consumption.

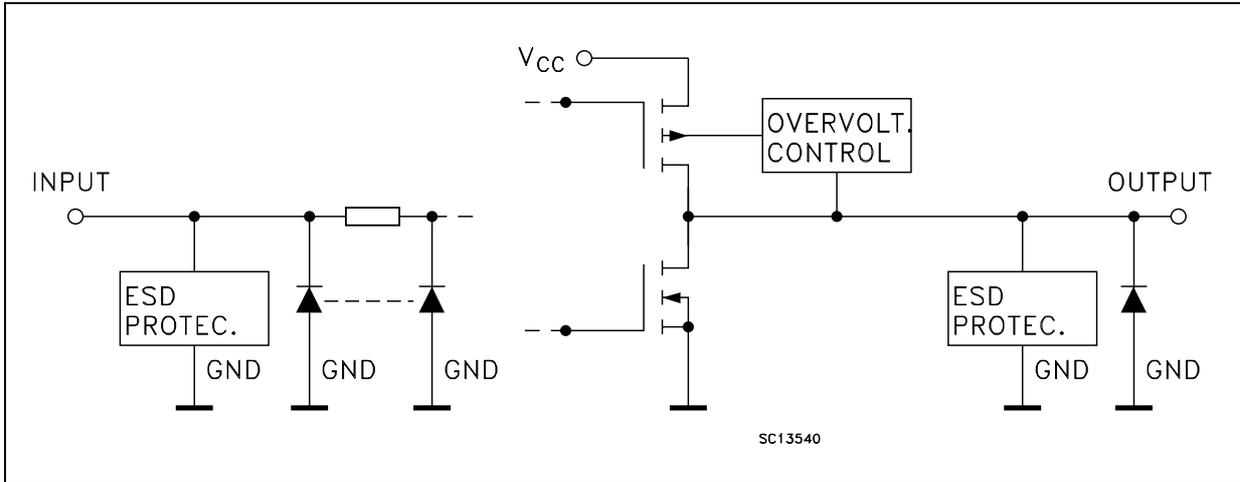

All inputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.

All floating bus terminals during High Z State must be held HIGH or LOW.
