### DESCRIPTION

The 74VHC594 is an high speed CMOS 8-BIT SHIFT REGISTERS fabricated with sub-micron silicon gate C<sup>2</sup>MOS technology.

This device contains an 8-bit serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. Separate clocks and direct overriding clear (SCLR, RCLR) are provided for both the shift register and the storage register.

A serial ( $Q_H'$ ) output is provided for cascading purposes. Both the shift register and storage register use positive-edge triggered clocks. If the

clocks are connected together, the shift register state will always be one clock pulse ahead of the storage register.

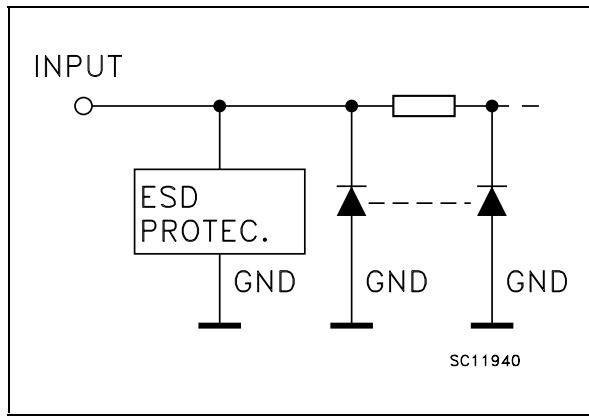

Power down protection is provided on all inputs and 0 to 7V can be accepted on inputs with no regard to the supply voltage. This device can be used to interface 5V to 3V.

All inputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.

				TA = 25°C			-40 to 85°C		-55 to 125°C	
		Min.	Typ.	Max.	Min.	Max.	Min.	Max.	Min.	
C <sub>IN</sub>	Input Capacitance			7						pF
C <sub>OUT</sub>	Output Capacitance			9						pF
C <sub>PD</sub>	Power Dissipation Capacitance (note 1)			70						pF

1) C<sub>PD</sub> is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation.  $I_{CC(opr)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}$
