

Features

- Industry Standard Architecture
Emulates Many 20-Pin PALs®
Low Cost Easy-to-Use Software Tools
- High Speed Electrically Erasable Programmable Logic Devices
5 ns Maximum Pin-to-Pin Delay
- Low Power - 100 μ A Pin-Controlled Power Down Mode Option
- CMOS and TTL Compatible Inputs and Outputs
I/O Pin Keeper Circuits
- Advanced Flash Technology
Reprogrammable
100% Tested
- High Reliability CMOS Process
20 Year Data Retention
100 Erase/Write Cycles
2,000V ESD Protection
200 mA Latchup Immunity
- Commercial and Industrial Temperature Ranges
- Dual-in-Line and Surface Mount Packages in Standard Pinouts

Block Diagram

Note: 1. Includes optional PD control pin.

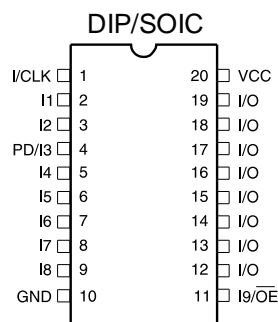

Description

The ATF16V8C is a high performance EECMOS Programmable Logic Device that utilizes Atmel's proven electrically erasable Flash memory technology. Speeds down to 5 ns and a 100 μ A pin-controlled power down mode option are offered. All speed ranges are specified over the full $5V \pm 10\%$ range for industrial temperature ranges; $5V \pm 5\%$ for commercial range 5-volt devices.

(continued)

Pin Configurations

| Pin Name | Function |
|-----------------|-----------------------|
| CLK | Clock |
| I | Logic Inputs |
| I/O | Bidirectional Buffers |
| \overline{OE} | Output Enable |
| VCC | +5V Supply |
| PD | Power Down |

Top view

Description (Continued)

The ATF16V8C incorporates a superset of the generic architectures, which allows direct replacement of the 16R8 family and most 20-pin combinatorial PLDs. Eight outputs are each allocated eight product terms. Three different modes of operation, configured automatically with software, allow highly complex logic functions to be realized.

The ATF16V8C can significantly reduce total system power, thereby enhancing system reliability and reducing

power supply costs. When pin 4 is configured as the power down control pin, supply current drops to less than 100 μ A whenever the pin is high. If the power down feature isn't required for a particular application, pin 4 may be used as a logic input. Also, the pin keeper circuits eliminate the need for internal pull-up resistors along with their attendant power consumption.

Absolute Maximum Ratings*

| | |
|--|--------------------------------|
| Temperature Under Bias..... | -40°C to +85°C |
| Storage Temperature | -65°C to +150°C |
| Voltage on Any Pin with Respect to Ground..... | -2.0V to +7.0V ⁽¹⁾ |
| Voltage on Input Pins with Respect to Ground During Programming..... | -2.0V to +14.0V ⁽¹⁾ |
| Programming Voltage with Respect to Ground..... | -2.0V to +14.0V ⁽¹⁾ |

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note:

1. Minimum voltage is -0.6V dc, which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is $V_{CC} + 0.75V$ dc, which may overshoot to 7.0V for pulses of less than 20 ns.

DC and AC Operating Conditions

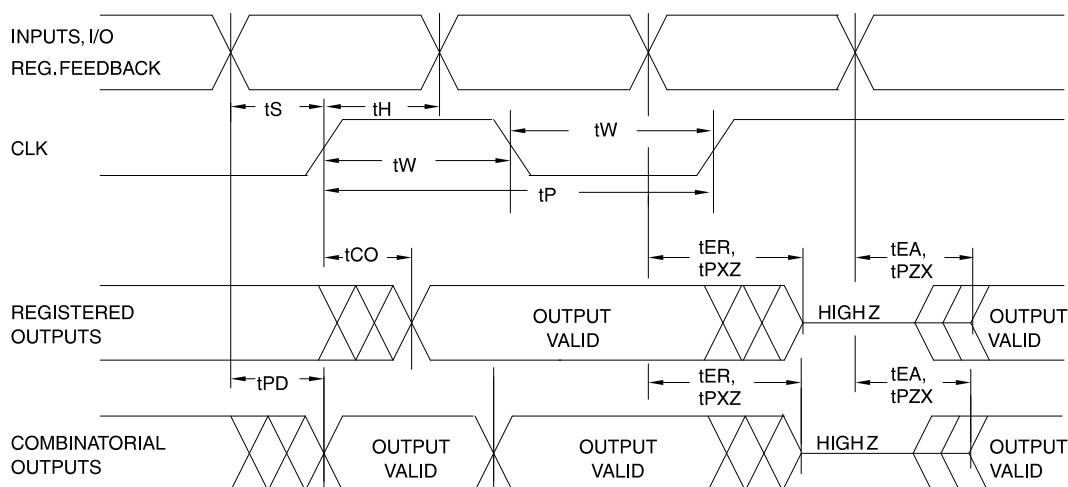

| | Commercial | Industrial |
|------------------------------|-------------|--------------|
| Operating Temperature (Case) | 0°C - 70°C | -40°C - 85°C |
| V_{CC} Power Supply | 5V \pm 5% | 5V \pm 10% |

DC Characteristics

| Symbol | Parameter | Condition | Min | Typ | Max | Units |
|-----------------|---------------------------------------|---|------------|-----|--------------|---------|
| I_{IL} | Input or I/O Low Leakage Current | $0 \leq V_{IN} \leq V_{IL}(MAX)$ | | | -10 | μA |
| I_{IH} | Input or I/O High Leakage Current | $3.5 \leq V_{IN} \leq V_{CC}$ | | | 10 | μA |
| $I_{CC1}^{(1)}$ | Power Supply Current, Standby | 15 MHz, $V_{CC} = MAX$, $V_{IN} = 0$, V_{CC} , Outputs Open | Com. | | 115 | mA |
| | | | Ind. | | 130 | mA |
| I_{PD} | Power Supply Current, Power Down Mode | $V_{CC} = MAX$, $V_{IN} = 0$, V_{CC} | Com. | 10 | 100 | μA |
| | | | Ind. | 10 | 105 | μA |
| I_{OS} | Output Short Circuit Current | $V_{OUT} = 0.5V$; $V_{CC} = 5V$; $T_A = 25^\circ C$ | | | -150 | mA |
| V_{IL} | Input Low Voltage | $MIN < V_{CC} < MAX$ | -0.5 | | 0.8 | V |
| V_{IH} | Input High Voltage | | 2.0 | | $V_{CC} + 1$ | V |
| V_{OL} | Output Low Voltage | $V_{CC} = MIN$; All Outputs $I_{OL} = 24$ mA | Com., Ind. | | 0.5 | V |
| V_{OH} | Output High Voltage | $V_{CC} = MIN$ $I_{OL} = -4.0$ mA | 2.4 | | | V |
| I_{OL} | Output Low Current | $V_{CC} = MIN$ | Com. | 24 | | mA |
| | | | Ind. | 12 | | mA |
| I_{OH} | Output High Current | $V_{CC} = MIN$ | Com., Ind. | | -4 | mA |

Note: 1. All I_{CC} parameters measured with outputs open.

AC Waveforms⁽¹⁾

Note: 1. Timing measurement reference is 1.5V. Input AC driving levels are 0.0V and 3.0V, unless otherwise specified.

AC Characteristics

| Symbol | Parameter | -5 | | -7 | | Units |

Output Test Loads: Commercial

Pin Capacitance ($f = 1\text{ MHz}$, $T = 25^\circ\text{C}$) ⁽¹⁾

| | Typ | Max | Units | Conditions |
|-----------|-----|-----|-------|-----------------------|
| C_{IN} | 5 | 8 | pF | $V_{IN} = 0\text{V}$ |
| C_{OUT} | 6 | 8 | pF | $V_{OUT} = 0\text{V}$ |

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.

Power Up Reset

The ATF16V8C's registers are designed to reset during power up. At a point delayed slightly from V_{CC} crossing V_{RST} , all registers will be reset to the low state. As a result, the registered output state will always be high on power-up.

This feature is critical for state machine initialization. However, due to the asynchronous nature of reset and the uncertainty of how V_{CC} actually rises in the system, the following conditions are required:

- 1) The V_{CC} rise must be monotonic, from below .7 volts,
- 2) After reset occurs, all input and feedback setup times must be met before driving the clock term high, and
- 3) The signals from which the clock is derived must remain stable during t_{PR} .

| Parameter | Description | Typ | Max | Units |
|-----------|------------------------|-----|-------|-------|
| t_{PR} | Power-Up Reset Time | 600 | 1,000 | ns |
| V_{RST} | Power-Up Reset Voltage | 3.8 | 4.5 | V |

Power Down Mode

The ATF16V8C includes an optional pin controlled power down feature. Device pin 4 may be configured as the power down pin. When this feature is enabled and the power down pin is high, total current consumption drops to less than 100 μ A. In the power down mode, all output data and internal logic states are latched and held. All registered and combinatorial output data remains valid. Any outputs which were in a HI-Z state at the onset of power down will remain at HI-Z. During power down, all input signals except the power down pin are blocked. The input and I/O pin keeper circuits remain active to insure that pins do not float to indeterminate levels. This helps to further reduce system power.

Selection of the power down option is specified in the ATF16V8C logic design file. The logic compiler will include this option selection in the otherwise standard 16V8 JEDEC fuse file. When the power down feature is not specified in the design file, pin 4 is available as a logic input, and there is no power down pin. This allows the ATF16V8C to be programmed using any existing standard 16V8 fuse file.

Note: Some programmers list the JEDEC-compatible 16V8C (No PD used) separately from the non-JEDEC compatible 16V8CEXT. (EXT for extended features.)

Registered Output Preload

The ATF16V8C's registers are provided with circuitry to allow loading of each register with either a high or a low. This feature will simplify testing since any state can be forced into the registers to control test sequencing. A JEDEC file with preload is generated when a source file with vectors is compiled. Once downloaded, the JEDEC file preload sequence will be done automatically by approved programmers.

Security Fuse Usage

A single fuse is provided to prevent unauthorized copying of the ATF16V8C fuse patterns. Once programmed, fuse verify and preload are inhibited. However, the 64-bit User Signature remains accessible.

The security fuse will be programmed last, as its effect is immediate.

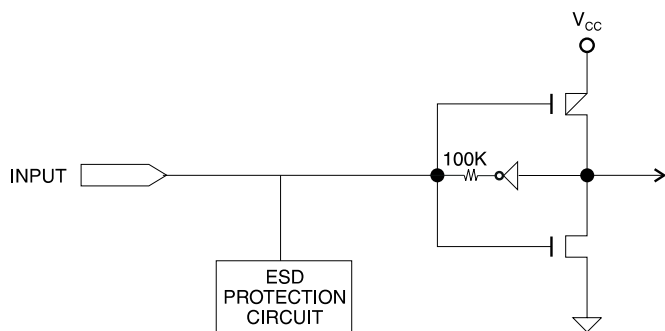

Input and I/O Pin Keeper Circuits

The ATF16V8C contains internal input and I/O pin keeper circuits. These circuits allow each ATF16V8C pin to hold its previous value even when it is not being driven by an external source or by the device's output buffer. This helps insure that all logic array inputs are at known, valid logic levels. This reduces system power by preventing pins from floating to indeterminate levels. By using pin keeper

circuits rather than pull-up resistors, there is no DC current required to hold the pins in either logic state (high or low).

These pin keeper circuits are implemented as weak feed-back inverters, as shown in the Input Diagram below. These keeper circuits can easily be overdriven by standard TTL- or CMOS-compatible drivers. The typical overdrive current required is 40 μ A.

Input Diagram

I/O Diagram

Functional Logic Diagram Description

The Logic Option and Functional Diagrams describe the ATF16V8C architecture. Eight configurable macrocells can be configured as a registered output, combinatorial I/O, combinatorial output, or dedicated input.

The ATF16V8C can be configured in one of three different modes. Each mode makes the ATF16V8C look like a different device. Most PLD compilers can choose the right mode automatically. The user can also force the selection by supplying the compiler with a mode selection. The determining factors would be the usage of register versus combinatorial outputs and dedicated outputs versus outputs with output enable control.

The ATF16V8C universal architecture can be programmed to emulate many 20-pin PAL devices. These ar-

chitectural subsets can be found in each of the configuration modes described in the following pages. The user can download the listed subset device JEDEC programming file to the PLD programmer, and the ATF16V8C can be configured to act like the chosen device. Check with your programmer manufacturer for this capability.

Unused product terms are automatically disabled by the compiler to decrease power consumption. A Security Fuse, when programmed, protects the content of the ATF16V8C. Eight bytes (64 fuses) of User Signature are accessible to the user for purposes such as storing project name, part number, revision, or date. The User Signature is accessible regardless of the state of the Security Fuse.

Compiler Mode Selection

Notes: 1. Please call Atmel PLD Hotline at (408) 436-4333 for more information.
2. Only applicable for version 3.4 or lower.

Macrocell Configuration

Software compilers support the three different OMC modes as different device types. These device types are listed in the table below. Most compilers have the ability to automatically select the device type, generally based on the register usage and output enable (OE) usage. Register usage on the device forces the software to choose the registered mode. All combinatorial outputs with OE controlled by the product term will force the software to choose the complex mode. The software will choose the simple mode only when all outputs are dedicated combinatorial without OE control. The different device types listed in the table can be used to override the automatic device selection by the software. For further details, refer to the compiler software manuals.

When using compiler software to configure the device, the user must pay special attention to the following restrictions in each mode.

ATF16V8C Registered Mode

PAL Device Emulation / PAL Replacement

The registered mode is used if one or more registers are required. Each macrocell can be configured as either a registered or combinatorial output or I/O, or as an input. For a registered output or I/O, the output is enabled by the \overline{OE} pin, and the register is clocked by the CLK pin. Eight product terms are allocated to the sum term. For a combinatorial output or I/O, the output enable is controlled by a product term, and seven product terms are allocated to the

In **registered mode** pin 1 and pin 11 are permanently configured as clock and output enable, respectively. These pins cannot be configured as dedicated inputs in the registered mode.

In **complex mode** pin 1 and pin 11 become dedicated inputs and use the feedback paths of pin 19 and pin 12 respectively. Because of this feedback path usage, pin 19 and pin 12 do not have the feedback option in this mode.

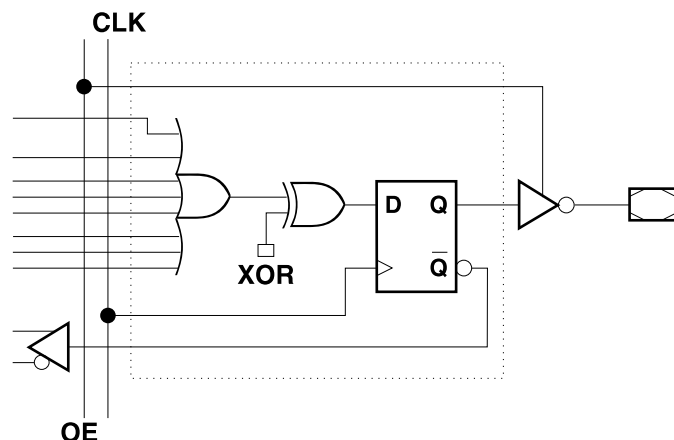

In **simple mode** all feedback paths of the output pins are routed via the adjacent pins. In doing so, the two inner most pins (pins 15 and 16) will not have the feedback option as these pins are always configured as dedicated combinatorial output.

sum term. When the macrocell is configured as an input, the output enable is permanently disabled.

Any register usage will make the compiler select this mode. The following registered devices can be emulated using this mode:

| | |
|------|-------|
| 16R8 | 16RP8 |
| 16R6 | 16RP6 |
| 16R4 | 16RP4 |

Registered Configuration for Registered Mode ^(1, 2)

Notes:

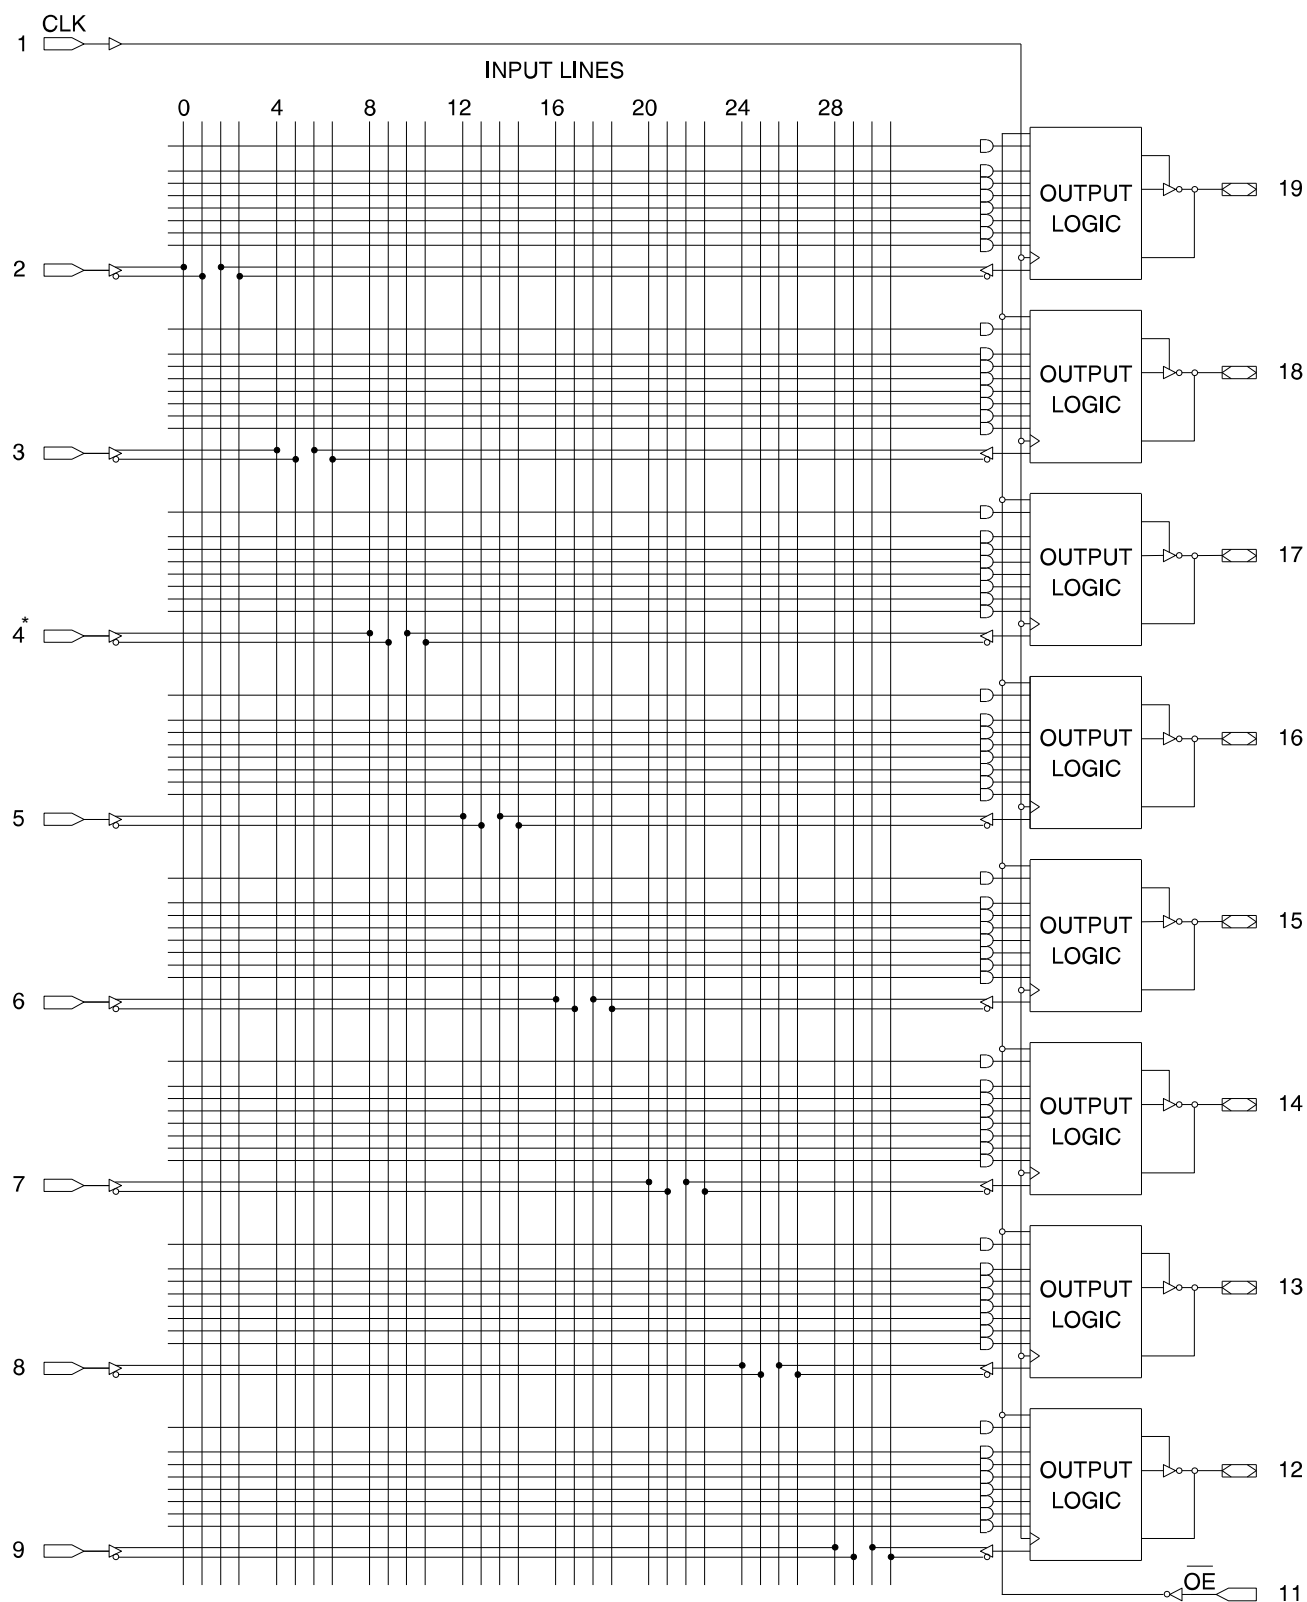

1. Pin 1 controls common CLK for the registered outputs.
Pin 11 controls common \overline{OE} for the registered outputs.
Pin 1 and Pin 11 are permanently configured as CLK and \overline{OE} .
2. The development software configures all the architecture control bits and checks for proper pin usage automatically.

Combinatorial Configuration for Registered Mode ^(1, 2)

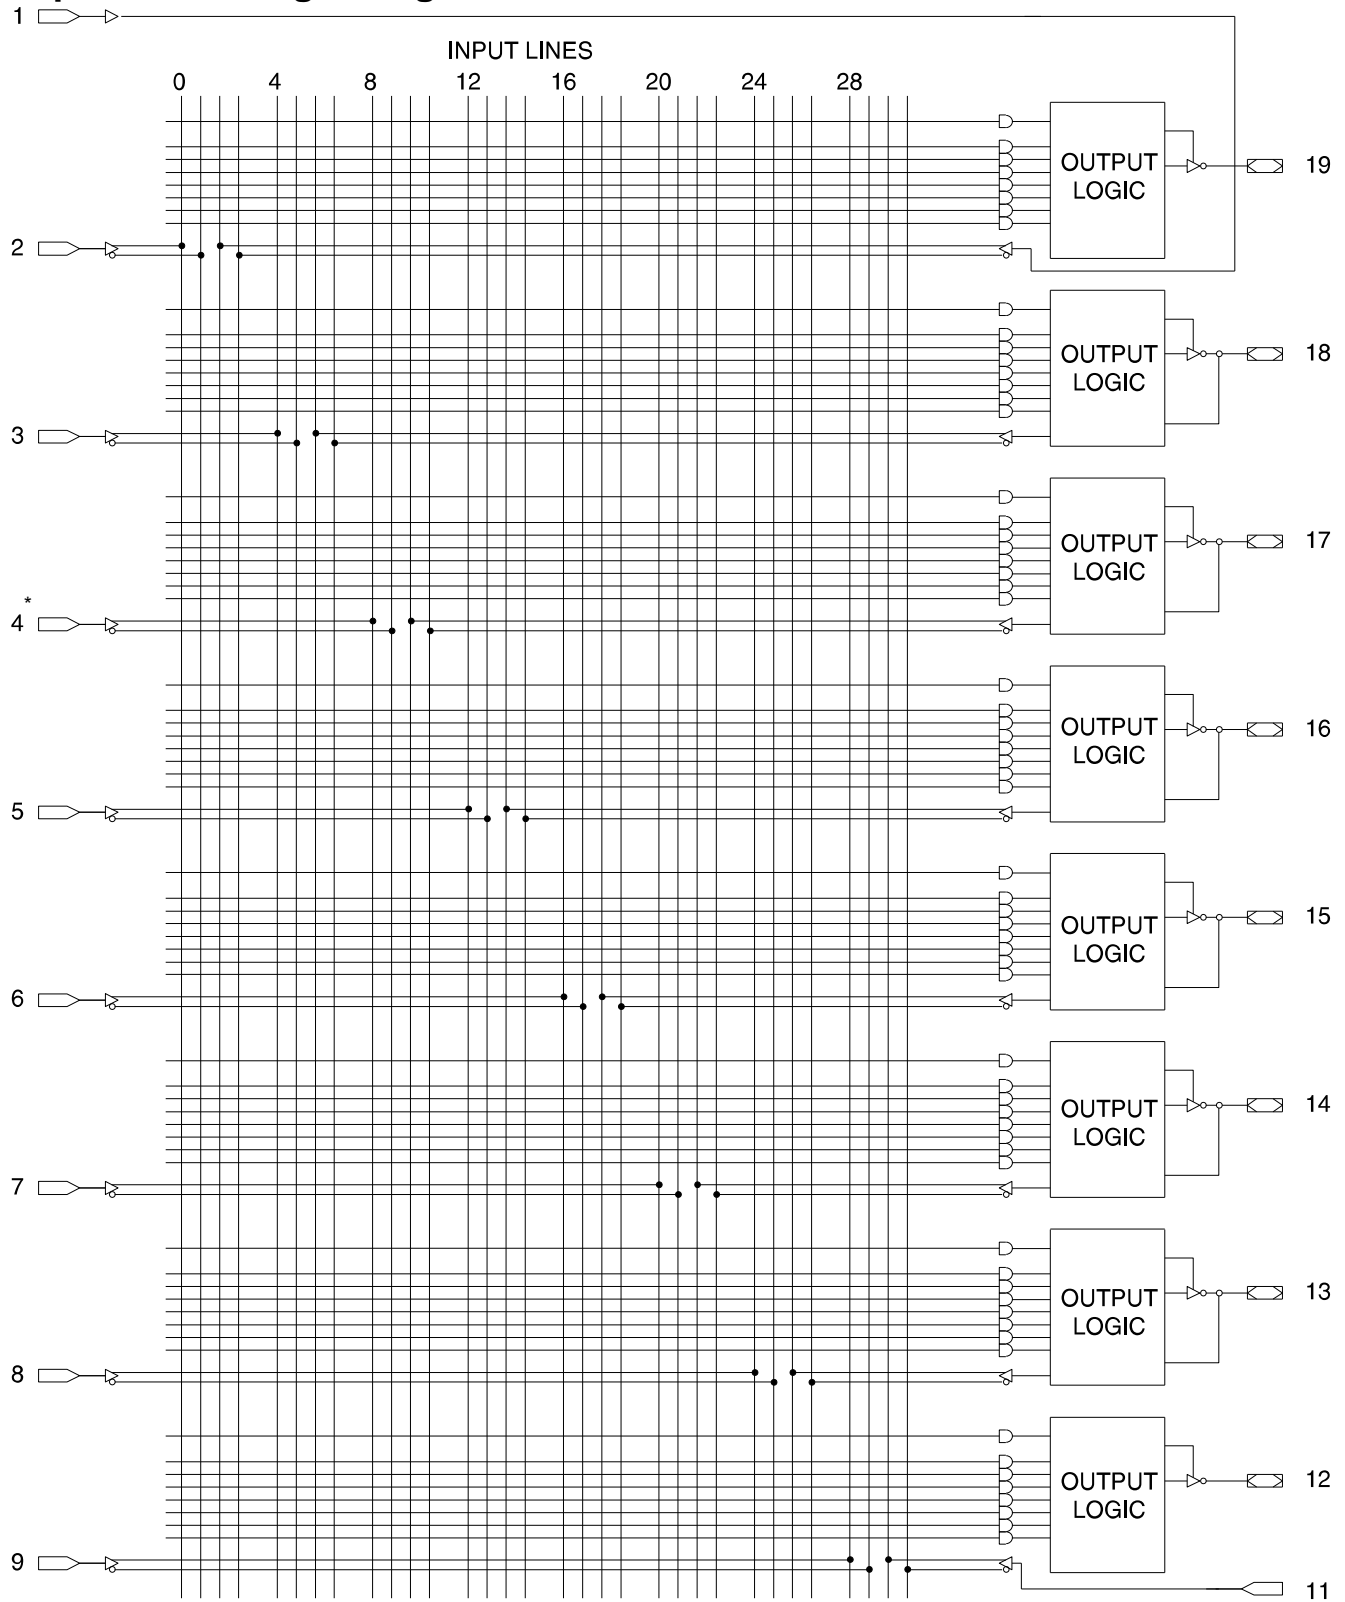

Notes:

1. Pin 1 and Pin 11 are permanently configured as CLK and \overline{OE} .
2. The development software configures all the architecture control bits and checks for proper pin usage automatically.
