

CA3081, CA3082

General Purpose High Current N-P-N Transistor Arrays

March 1993

Features

- CA3081 Common Emitter Array
- CA3082 Common Collector Array
- Directly Drive Seven Segment Incandescent Displays and Light Emitting Diode (LED) Display
- 7 Transistors Permit a Wide Range of Applications in Either a Common Emitter (CA3081) or Common Collector (CA3082) Configuration
- High I_C 100mA Max
- Low V_{CESAT} (at 50mA) 0.4 Typ

Applications

- · Drivers for
 - Incandescent Display Devices
 - LED Displays
 - Relay Control
 - Thyristor Firing

Description

CA3081 and CA3082 consist of seven high current (to 100mA) silicon n-p-n transistors on a common monolithic substrate. The CA3081 is connected in a common emitter configuration and the CA3082 is connected in a common collector configuration.

The CA3081 and CA3082 are capable of directly driving seven segment displays, and light emitting diode (LED) displays. These types are also well suited for a variety of other drive applications, including relay control and thyristor firing.

^{1.} The collector of each transistor of the CA3081 and CA3082 is isolated from the substrate by an integral diode. The substrate must be connected to a voltage which is more negative than any collector voltage in order to maintain isolation between transistors and provide normal transistor action. To avoid undesired coupling between transistors, the substrate terminal (5) should be maintained at either DC or signal (AC) ground. A suitable bypass capacitor can be used to establish a signal ground.

Typical Read - Out Driver Applications

* The Resistance for R is determined by the relationship:

$$R = \frac{V_P - V_{BE} - V_F (LED)}{I (LED)}$$

$$R = 0 \text{ for } V_P = V_{BE} + V_F \text{ (LED)}$$

Where: V_P = Input Pulse Voltage V_F = Forward Voltage Drop Across the Diode
