

## Quad SPST CMOS Analog Switches

**DG201A/DG211**

### General Description

The DG201A and DG211 are normally closed, quad single-pole single-throw (SPST) analog switches. These CMOS switches can be continuously operated with power supplies ranging from  $\pm 4.5V$  to  $\pm 18V$ . Maxim guarantees that these switches will not latch up if the power supplies are disconnected with input signals still connected.

Both devices have guaranteed break-before-make switching. The DG201A differs from the DG211 primarily in switching speeds. The DG201A has a maximum turn-off time of 450ns and a maximum turn-on time of 600ns. The DG211 has a maximum turn-off time of 500ns and a maximum turn-on time of 1000ns.

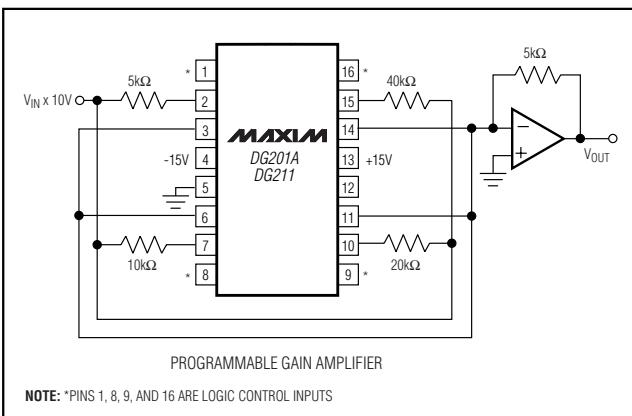

Compared to the original manufacturer's products, Maxim's DG201A and DG211 consume significantly lower power making them better suited for portable applications. Maxim has also eliminated the need for the third ( $V_L$ ) power supply that is required for the operation of the original manufacturer's DG211.

### Applications

- Winchester Disk Drives
- Test Equipment
- Communications Systems
- PBX, PABX
- Guidance and Control Systems
- Head Up Displays
- Military Radios

*Pin Configurations continued at end of data sheet.*

### Typical Operating Circuit

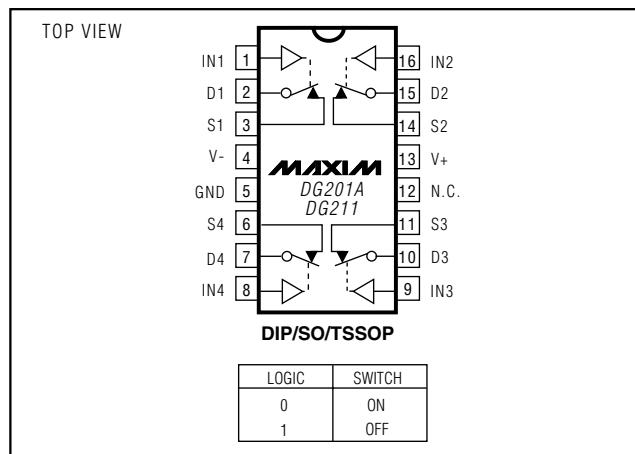

### Features

- ♦ Guaranteed  $\pm 4.5V$  to  $\pm 18V$  Operation
- ♦ No  $V_L$  Supply Required
- ♦ Nonlatching with Supplies Turned Off and Input Signals Present
- ♦ CMOS and TTL Logic Compatible
- ♦ Monolithic, Low-Power CMOS Design

3, 14, 11, 6	1, 12, 9, 4	S1-S4	Analog Switch Source Terminal
4	2	V-	Negative-Supply Voltage Input
5	3	GND	Ground
12	10	N.C.	No Connection
13	11	V+	Positive-Supply Voltage Input—Connected to Substrate

## Switching Time Test Circuit

Switch output waveform shown for V<sub>S</sub> = constant with logic input waveform as shown. Note that V<sub>S</sub> may be +ve or -ve as per switching times test circuit. V<sub>O</sub> is the steady state output with switch on. Feedthrough via gate capacitance may result in spikes at leading and trailing edge of output waveform.

## Typical R<sub>DS(ON)</sub> vs. Power Supplies for Maxim's DG201A, and DG211

POWER SUPPLIES	R <sub>DS(ON)</sub> AT ANALOG SIGNAL LEVEL					
	-5V	+5V	-10V	+10V	-15V	+15V
±5V	350Ω	380Ω	—	—	—	—
±10V	—	—	165Ω	250Ω	—	—
±15V	—	—	125Ω	160Ω	135Ω	155Ω

## Protecting Against Fault Conditions

Fault conditions occur when power supplies are turned off when input signals are still present, or when overvoltages occur at the inputs during normal operation. In either case, source-to-body diodes can be forward biased and conduct current from the signal source. If this current is required to be kept to low ( $\mu$ A) levels then the addition of external protection diodes is recommended.

## Pin Configurations (continued)

To provide protection for overvoltages up to 20V above the supplies, a 1N4001 or 1N914 type diode should be placed in series with the positive and negative supplies as shown in Figure 2. The addition of these diodes will reduce the analog signal range to 1V below the positive supply and 1V above the negative supply.
