

Monolithic CMOS Analog Multiplexers

General Description

Maxim's DG508A and DG509A are monolithic CMOS analog multiplexers (muxes): the DG508A is a single 8-channel (1-of-8) mux, and the DG509 is a differential 4-channel (2-of-8) mux.

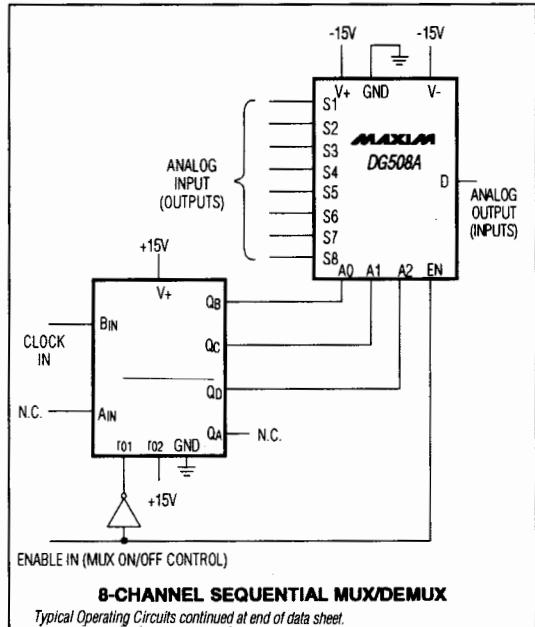

Both devices guarantee break-before-make switching. Maxim guarantees these muxes will not latch up if the power supplies are turned off with the input signals still present. Maxim also guarantees continuous operation when these devices are powered by supplies ranging from $\pm 4.5V$ to $\pm 18V$.

The DG508A/DG509A are plug-in upgrades for the industry-standard DG508A/DG509A, respectively. Maxim's parts have lower on resistance, faster enable switching times, and significantly lower leakage currents. The DG508A/DG509A also consume significantly lower power, making them ideal for portable equipment.

ABSOLUTE MAXIMUM RATINGS

Voltage Referenced to V-

V+	+44V
GND	+25V
Digital Inputs, Vs and Vd (Note 1)	-2V to (V+ + 2V) or 20mA, whichever occurs first
Current (any terminal, except S or D)	30mA
Continuous Current, S or D	20mA
Peak Current, S or D (pulsed at 1ms, 10% duty cycle max)	40mA
Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)	
Plastic DIP (derate 10.53mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	842mW
Narrow SO (derate 8.70mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	696mW
Wide SO (derate 9.52mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	762mW
CERDIP (derate 10.00mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	800mW

Note 1: Signals on S-, D-, or IN- exceeding V+ or V- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.

Note 2: I_{D(ON)} is leakage from driver into "on" switch.

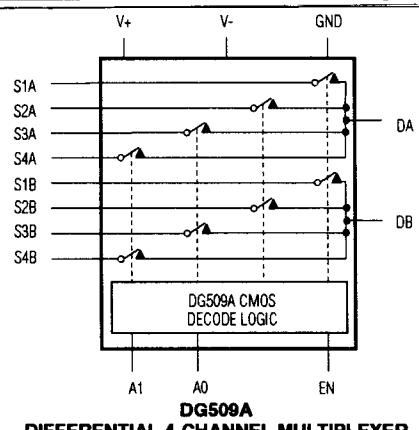

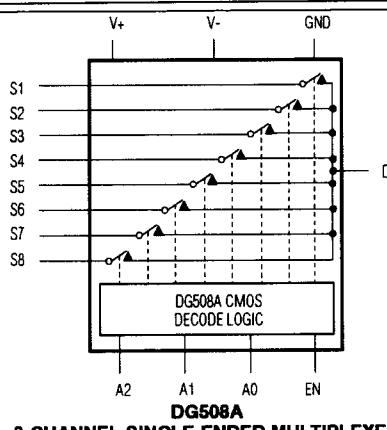

Note 3: Off isolation = $20\log \frac{|V_S|}{|V_D|}$,

V_S = input to "off" switch,
V_D = output due to V_S.

Note 4: Electrical characteristics (such as on resistance) will change when power supplies other than ±15V are used.

Note 5: For designs requiring single 5V or dual ±5V operation, refer to Maxim's improved MAX338 and MAX339. Minimum operating voltage for DG508ADY and DG509ADY is ±9V.
