

FAN8004

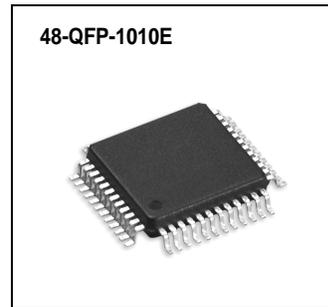

5-CH Motor Driver

Features

- 4-CH Balanced Transformerless (BTL) Driver
- 1-CH (Forward Reverse) Control DC Motor Driver
- Operating Supply Voltage (4.5V ~ 13.2V)
- Built-in Thermal Shut Down Circuit (TSD)
- Built-in Under Voltage Lockout Circuit (UVLO)
- Built-in Over Voltage Protection Circuit (OVP)
- Built-in Mute Circuit (CH1, CH2, CH3 and CH4)
- Built-in Normal OP-AMP
- Built-in 5V Regulator With Reset

Description

The FAN8004 is a monolithic integrated circuit suitable for a 5-CH motor driver which drives the tracking actuator, focus actuator, sled motor, spindle motor, and tray motor of the CDP/DVDP/MDP system.

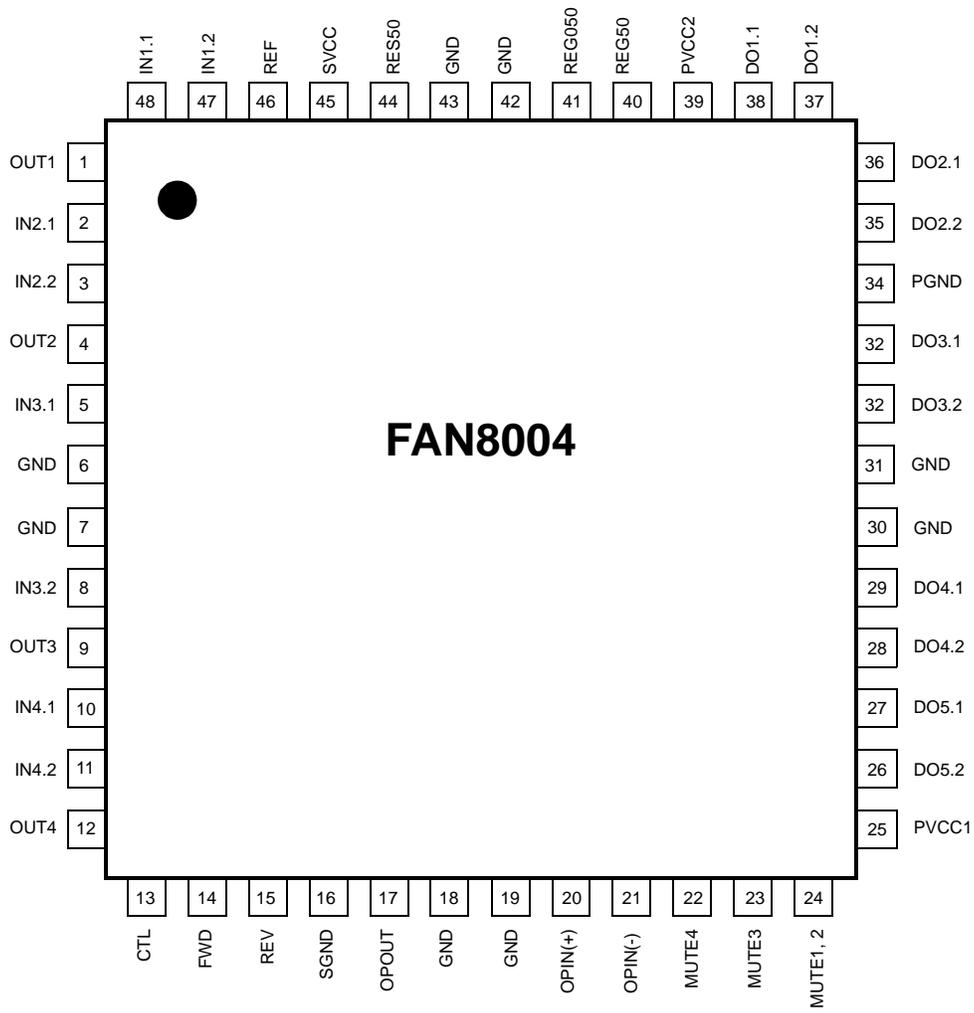

Typical Applications

- Compact Disc Player
- Mini Disc Player
- Digital Video Disk Player

Absolute Maximum Ratings (Ta = 25°C)

Parameter	Symbol	Value	Unit
Maximum Supply Voltage	VCCMAX	18	V
Power Dissipation	PD	2.3 ^{note}	W
Operating Temperature	TOPR	-35 ~ +85	°C
Storage Temperature	TSTG	-55 ~ +150	°C
Maximum Output Current	IOMAX	1	A

Note:

1. When mounted on 70mm × 70mm × 1.6mm PCB.
2. Power dissipation reduces 18.4mW / °C for using above Ta=25°C.
3. Do not exceed Pd and SOA.

Recommended Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Unit
Signal Supply Voltage	SVCC	4.5	-	13.2	V
Power Supply Voltage	PVCC1	4.5	-	13.2	V
Power Supply Voltage	PVCC2	4.5	-	13.2	V

Electrical Characteristics (Ta = 25°C)

(SVCC=PVCC1=PVCC2=8V, Ta=25°C, unless otherwise specified)

Application Information

1. Reference Input & Mute

Pin 46 (REF) uses the reference input pin or the all mute input pin a reference input block circuit.

- Reference input
In the case of external reference input, the applied voltage range must be between 2[V] and 6.5[V] at $V_{CC}=8[V]$.
- All mute input
Using the all mute function pin, the applied voltage condition is as follows.

All Mute On Voltage	Below 0.5[V]	Mute Function Operation
All Mute Off Voltage	Above 2.0[V]	Normal Operation

2. Separated Channel Mute Function

These pins are used for the individual channel mute operation.

- When the mute pins (pin22, 23 and 24) are high level, the mute circuits are activated so that the output circuit is muted.
- When the voltage of the mute pins (pin22, 23 and 24) are low level, the mute circuit is stopped and output circuits operate normally.
- If the chip temperature rises above 175°C, then the thermal shutdown (TSD) circuit is activated and the output circuits are muted.
 - Mute 1, 2 (pin 24)-CH1, 2 mute control input pin.
 - Mute 3 (pin 23)-CH3 mute control input pin.
 - Mute 4 (pin 22)-CH4 mute control input pin.

3. Protection Function

- Thermal shutdown (TSD)
If the chip temperature rises above 175°C, then the thermal shutdown (TSD) circuit is activated and the output circuit is mute. The TSD circuit is temperature hysteresis about 25°C.
- Under voltage lockout (UVLO) and over voltage protection (OVP)
It is designed to mute operate the internal bias by the function of UVLO and OVP, when the power supply voltage falls below 3.5[V] or above 20[V].

4. Regulator & Reset Function

The regulator and reset circuits are as illustrated in Figure 1.
where $R1=R2$.

- The external circuit is composed of the transistor, KSB772 and a capacitor, about 33[mF]. The capacitor is used as a ripple eliminator and should have good temperature characteristics.
- The regulator output voltage (pin 41) is decided as follows.
 $V_{out} = 2 \times 2.5 = 5[V]$ (where $R1=R2$)
- When the voltage of pin 44 (V_{reset}) is at 5[V], regulator output voltage(pin 41) is 5[V], and if 0[V], the output voltage of pin 41 is 0[V].

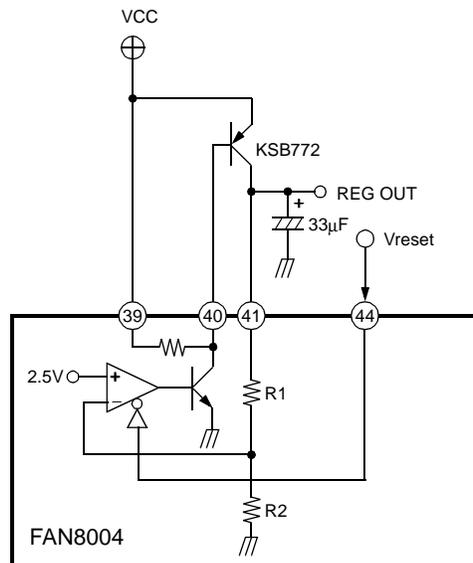

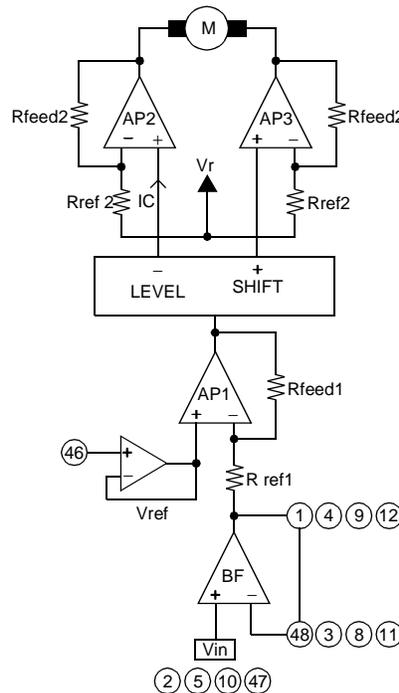

Figure 1. Regulator circuit

5. Focus, Tracking Actuator, Spindle, Sled Motor Drive Part

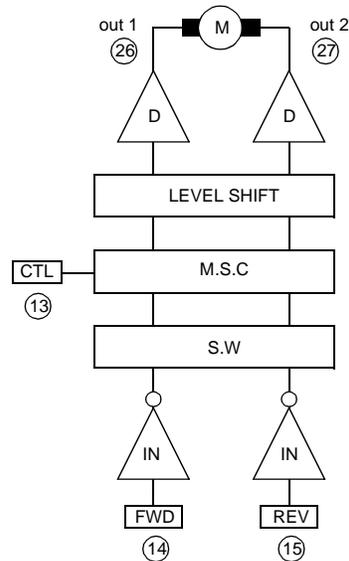

- The voltage, V_{ref} is the reference voltage given by the external bias voltage of pin 46.
- The input signal (V_{in}) through pin 2, 5, 10 and 47 are by the AP1 amplified one times ($R_{ref1}=R_{feed1}$) and then fed to the level shift.
- The level shift produces the current due to the difference between the input signal and the arbitrary reference signal. The current produced as $+\Delta I$ and $-\Delta I$ are fed into the output amplifier. Where output amplifier (AP2, 3) gain is two times (all $R_{ref2} = R_{feed2}$).
- If you desire to change the gain, the input buffer amplifier (BF) can be used.
- The output stage is the balanced transformerless (BTL) driver.

- The bias voltage V_r is expressed as below;

$$V_r = \frac{V_{CC} - V_{BE}}{2} [V]$$

6. Tray, Change Motor Drive Part

- Rotational Direction Control

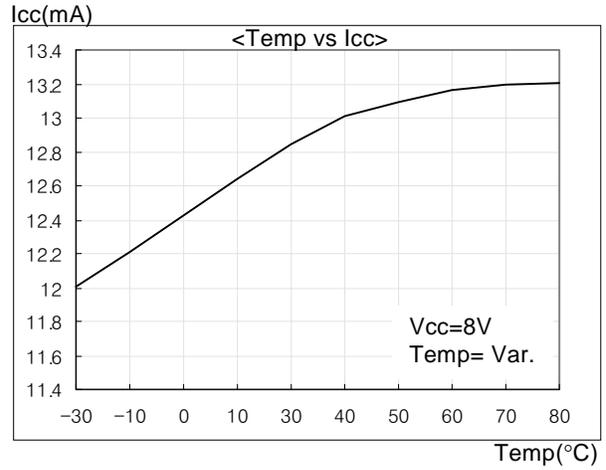

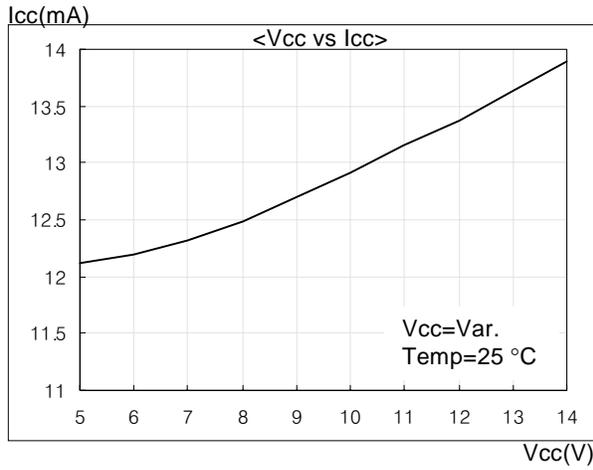

The forward and reverse rotational direction is controlled by FWD (pin 14), and REV (pin 15) inputs. Conditions are as follows.

INPUT		OUTPUT		
FWD	REV	OUT 1	OUT 2	State
H	H	V_r	V_r	Brake
H	L	H	L	Forward
L	H	L	H	Reverse
L	L	V_r	V_r	Brake

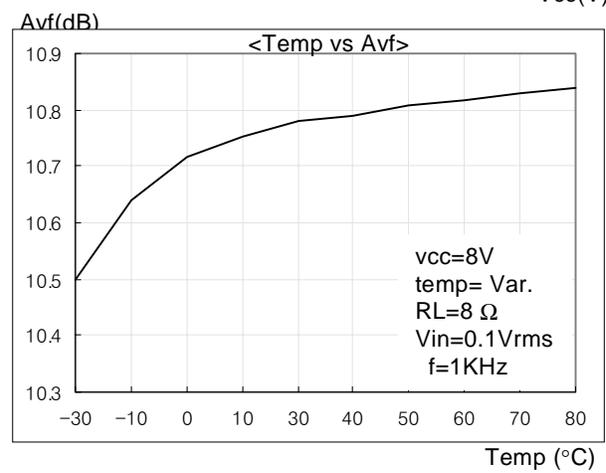

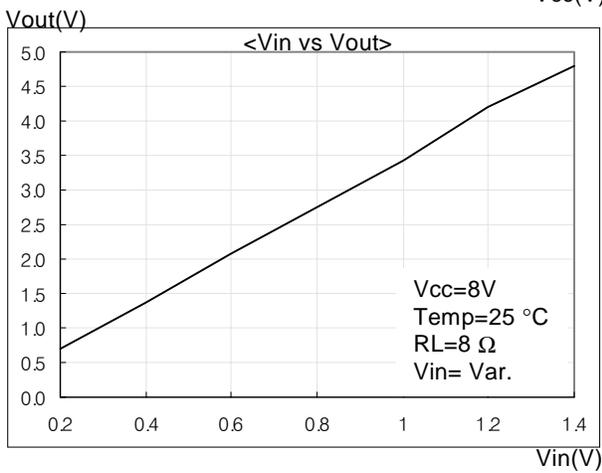

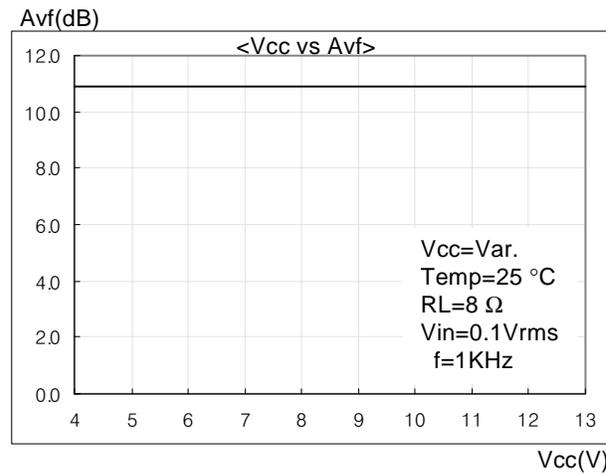

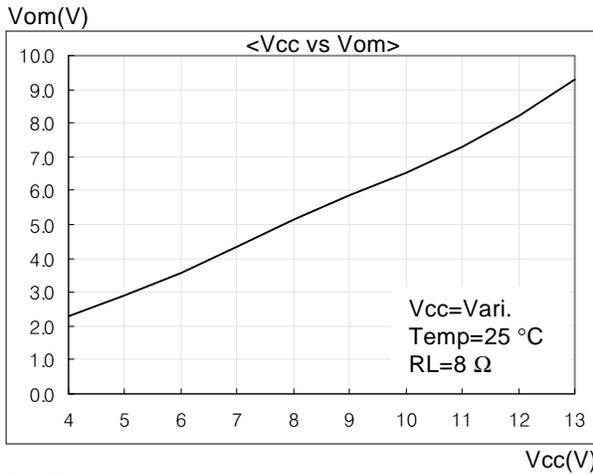

- Where $V_{ris} = (V_{CC} - V_{be}) / 2 = 3.65V$ (at $V_{CC} = 8V$)
- Motor Speed Control
 - The almost maximum torque is obtained when it is used with the pins 13 (CTL) open.
 - If the torque of the motor is too low, then the applied voltage at pins 13 (CTL) is 0[V].
 - When motor speed controlled, the applied voltage of the pins 13 (CTL) is between 0 and 4V. Also, if speed control is constant, the applied voltage of the pins 13 (CTL) is between 4 and 5V.
 - This IC's applied maximum voltage is 6V when V_{CC} is 8V.
 - You must not use the applied CTL voltage above 5.8V when V_{cc} is 8V, and 3V when V_{CC} is 5V.
