## Application Information

### 1. FORWARD AND REVERSE CONTROL LOGIC

Pin #5	Pin #6	Pin #2	Pin #10	Function
L (0.7V ↓)	L (0.7V ↓)	L	L	Brake
L (0.7V ↓)	H (2.0V ↑)	L	H	Reverse
H (2.0V ↑)	L (0.7V ↓)	H	L	Forward
H (2.0V ↑)	H (2.0V ↑)	H	H	Brake

- If pin #5=H, pin #6=L, load current flows from pin #2 to pin #10 through a motor.
- If pin #5=L, pin #6=H, load current flows from pin #10 to pin #2 through a motor.
- If pin #5=pin #6=L or pin #5=pin #6=H, the KA8301 stops supplying the power to motor while absorbing counter EMF from the motor as a brake.

### 2. RUSH CURRENT RESTRICTING CIRCUIT

If a high voltage generated during reversing operation is applied across pin #2 and pin #10, an internal comparator activates the rush current restricting circuit.

### 3. DRIVE CIRCUIT

In the forward mode, the drive circuit supplies a load current to the motor from pin #2 to pin #10.  
In the reverse mode, it supplies the current from pin #10 to pin #2.

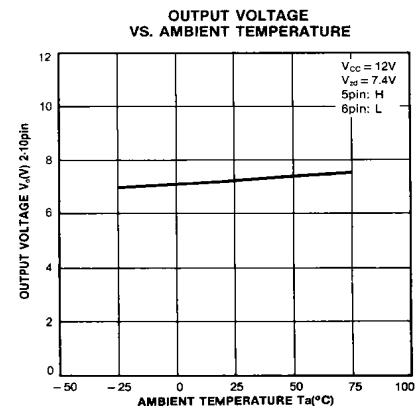

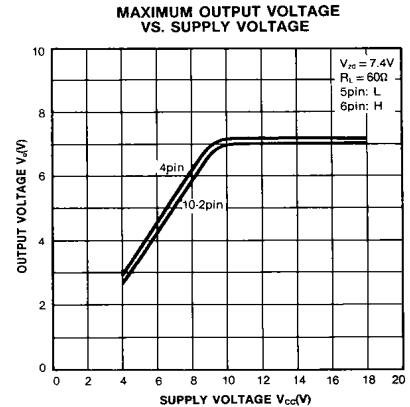

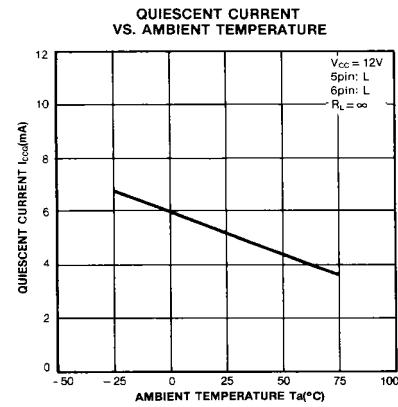

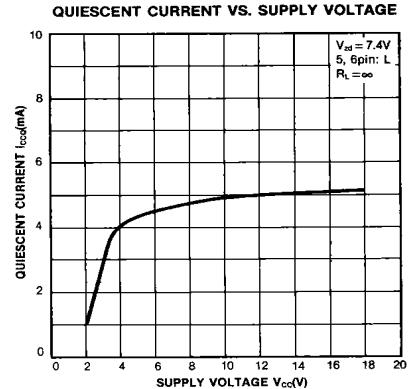

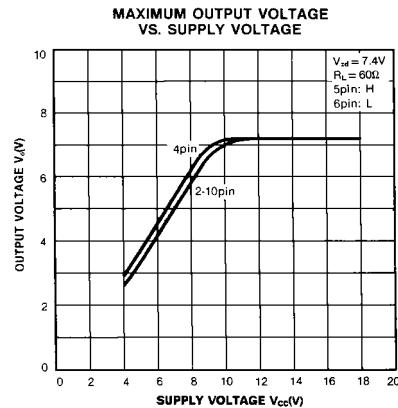

The output voltage ( $V_{OUT}$ ) applied to the motor is given by the followings;

$$V_{OUT} = V_{ZD} - V_{CE(sat)}$$
, where  $V_{ZD}$ : a zener voltage applied to pin #4

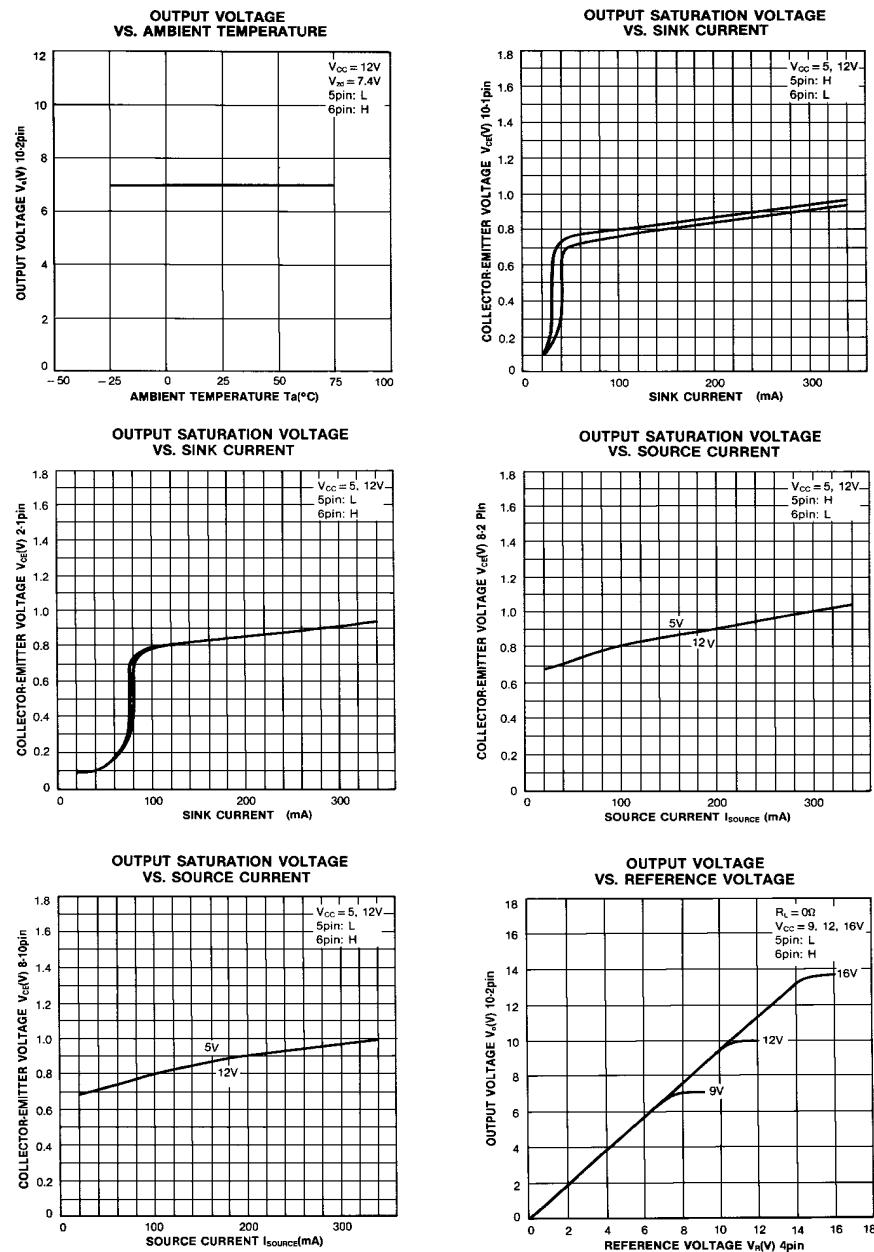

If pin #4 is left open, the output voltage is given by the followings;

$$V_{OUT} = V_{CC1} - V_{CE(sat, pnp)} - 2V_F - V_{CE(sat)}$$
