

UTC LS1240A LINEAR INTEGRATED CIRCUIT

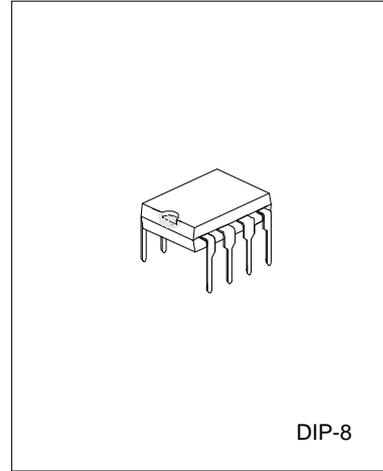

ELECTRONIC TONE RINGER WITH BUILT-IN BRIDGE RECTIFIER

DESCRIPTION

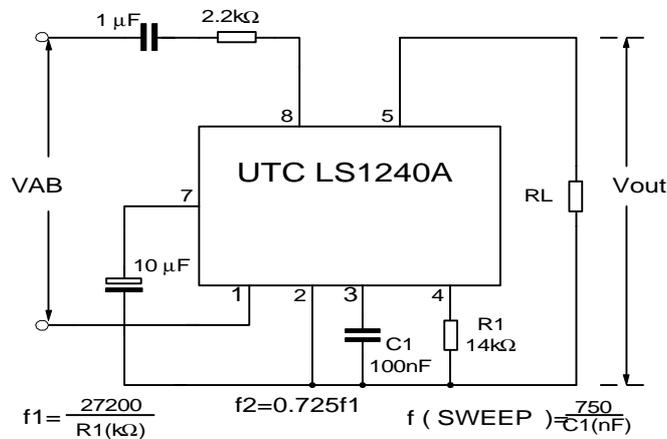

The UTC LS1240A is a monolithic integrated circuit, designed to be as a telephone ringer. It can drive directly a piezo-ceramic converter (buzzer). The output current capacity of UTC LS1240A is higher than UTC LS1240. For driving a dynamic loudspeaker, UTC LS1240A needs only a decoupling capacitor.

FEATURES

- *Low current consumption, in order to allow the parallel operation of 4 devices.
- *Integrated rectifier bridge with zener diodes to protect against over voltage.
- *Little external circuitry.
- *Tone and switching frequencies adjustable by external components.
- *Integrated voltage and current hysteresis.

PIN CONFIGURATIONS

APPLICATION CIRCUIT

No current limitation is provided on the output stage of UTC LS1240A, so a minimum load DC of 50 ohms is advised.

The two tone frequencies generated are switched by an internal oscillator in a fast sequence and made audible across an output amplifier in the loudspeaker, both tone frequencies and the switching frequency can be externally adjusted. The signal and the circuit is designed so that noise on the line or variations of the ringing signal cannot affect correct operation of the device.
