DESCRIPTION

The M74HC4851 is a single eight-channel analog MULTIPLEXER/DEMUTIPLEXER fabricated with silicon gate C²MOS technology.

It is pin to pin compatible with the equivalent to standard HC4051 and MC14051, but feature injection current effect control. This make this device especially suited for usage in automotive applications where voltages in excess of normal

logic voltage are common. The injection current effect control allows signals at disabled input channels to exceed the supply voltage range or go down ground without affecting the signal of the enabled analog channel. This eliminated the need for external diode-resistor networks typically used to keep the analog channel signals within the supply voltage range. This analog switch is bidirectional and digitally controlled. It have three binary control inputs A, B, and C to select 1 of 8 to be turned on, and connected to the output, and a INH input to disable all channel.

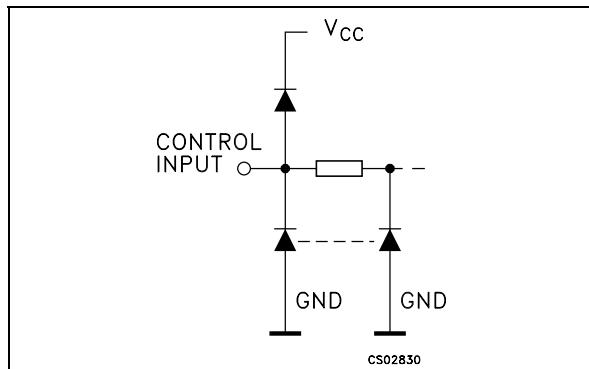

All inputs and outputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	2 to 6	V
$V_{I/O}$	Input Output Voltage	0 to V_{CC}	V
$V_{I/O}$	Static or Dynamic Voltage Across Switch (note1)	0 to 1.2	V
V_{IN}	Control Input Voltage	0 to V_{CC}	V
T_{op}	Operating Temperature	-55 to 125	°C
t_r, t_f	Input Rise and Fall Time (note2) (Channel Select or Enable Inputs only)	$V_{CC} = 2.0V$	0 to 1000
		$V_{CC} = 3.0V$	0 to 800
		$V_{CC} = 3.3V$	0 to 700
		$V_{CC} = 4.5V$	0 to 500
		$V_{CC} = 6.0V$	0 to 400

1) For voltage drops across switch greater than 1.2V (switch on), excessive V_{CC} current may be drawn; i.e., the current out of the switch may contain both V_{CC} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded.

2) V_{IN} from 30% to 70% V_{CC} of channel Selected or Enable Inputs
