RADIATION HARD 8192 x 8 BIT MASK-PROGRAMMABLE ROM

The MA3864 64k Mask Programmable ROM is configured as 8192x8 bits and manufactured using CMOS-SOS high performance, radiation hard, 1.5µm technology.

The design has full static operation with no clock or timing strobe required. Address input buffers are deselected when chip select is in the HIGH state.

Programming is performed during fabrication by customising the penultimate layer of the process. Programming data may be supplied in EPROM or as a data file in the standard INTEL Hex format.

SIGNAL DEFINITIONS

A0-12

Address input pins which select a particular eight bit word within the memory array.

Q0-7

Data output pins

E1, E2, E3, E4

Are mask programmed, to the customer's specification, to form the active LOW chip select function ($\overline{E}$). $\overline{E}$ is driven by a 4-input NAND gate which has E1,E2,E3,E4 or their inverses as it's

inputs. Unused NAND gate I/Ps will be tied high internally. When chip select ($\overline{E}$) is low, a read is activated. When it is at a high level it defaults the ROM to a precharge condition and holds the data output drivers in a high impedance state.

$\overline{G}$

Output Enable which when at a high level holds the data output drivers in a high impedance state. When at a low level, data output driver state is defined by $\overline{CS}$. If this signal is not used it must be connected to VSS.

CHARACTERISTICS AND RATINGS

Symbol	Parameter	Min.	Max.	Units
V_{CC}	Supply Voltage	-0.5	7.0	V
V_I	Input Voltage	-0.3	$V_{DD}+0.3$	V
T_A	Operating Temperature	-55	125	°C
T_S	Storage Temperature	-65	150	°C

Stresses above those listed may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions, or at any other condition above those indicated in the operations section of this specification, is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RADIATION TOLERANCE

Total Dose Radiation Testing

For product procured to guaranteed total dose radiation levels, each wafer lot will be approved when all sample devices from each lot pass the total dose radiation test.

The sample devices will be subjected to the total dose radiation level (Cobalt-60 Source), defined by the ordering code, and must continue to meet the electrical parameters specified in the data sheet. Electrical tests, pre and post irradiation, will be read and recorded.

GEC Plessey Semiconductors can provide radiation testing compliant with MIL-STD-883 test method 1019, Ionizing Radiation (Total Dose).

Total Dose (Basic function)	1x10 ⁵ Rad(Si)
Total Dose (Function to specification)	1x10 ⁶ Rad(Si)
Transient Upset	>10 ¹¹ Rad(Si)/sec
Neutron Hardness (Function to specification)	>10 ¹⁵ neutrons/cm ²
Single Event Upset (GSO 10% worst case)	4.3x10 ⁻¹¹ errors/bitday
