#### **General Description**

The MAX1714B evaluation kit (EV kit) demonstrates a standard 4A application circuit. This DC-DC converter steps down high-voltage batteries and/or AC adapters, generating a precision, low-voltage rail for use as chipset, dynamic random-access memory (DRAM), and other low-voltage supplies.

The MAX1714B EV kit provides a 2.5V output voltage from a +4.5V to +24V battery input range. It delivers up to 4A output current with greater than 90% efficiency while operating at a 300kHz switching frequency, and has superior line- and load-transient response.

This EV kit is a fully assembled and tested circuit board. It also allows evaluation of other output voltages in the 1.0V to 5.5V range by changing feedback resistors R1 and R2.

#### Features

- +4.5V to +24V Input Voltage Range
- Preset 2.5V Output Voltage
- ♦ 1.0V to 5.5V Adjustable Output
- ♦ 4A Output Current
- ♦ 94% Efficient (V<sub>OUT</sub> = 2.5V, V<sub>BATT</sub> = 7V, I<sub>LOAD</sub> = 2A)
- ♦ 300kHz Switching Frequency
- ♦ No Current-Sense Resistor
- Power-Good Output
- ♦ 16-Pin QSOP Package
- Low-Profile Components
- Fully Assembled and Tested

**Note:** Please indicate that you are using the MAX1714B when contacting these component suppliers.

#### **Recommended Equipment**

- +5V to +24V power supply, battery, or notebook AC adapter
- DC bias power supply, 5V at 100mA
- Dummy load capable of sinking 4A
- Digital multimeter (DMM)
- 100MHz dual-trace oscilloscope

#### Quick Reference

- 1) Ensure that the circuit is connected correctly to the supplies and dummy load prior to applying any power.
- 2) Verify that the shunt is placed across JU1.
- Turn on the battery power before the +5V bias power; otherwise, the output undervoltage lockout (UVLO) timer will time out and the FAULT latch will be set, disabling the regulator until +5V power is cycled or shutdown is toggled.
- Observe the 2.5V output with the DMM and/or oscilloscope. Look at the LX switching node and MOS-FET gate-drive signals while varying the load current.

#### **Detailed Description**

#### **Jumper Settings**

Tables 1–4 show the functions you can achieve with various jumper settings.

#### **Evaluating Other Output Voltages**

The EV kit output is preset to +2.5V. However, the output voltage can also be adjusted between 1.0V and 5.5V by selecting R1 and R2 values. Cut the PC board trace shorting R2; then select feedback resistor R2 in the  $2k\Omega$  to  $20k\Omega$  range. R1 is then given by:

$$R1 = R2 [(V_{OUT} / V_{FB}) - 1]$$

where  $V_{FB} = 1.0V$ .

If a 3.3V output is desired, cut the trace shorting R2, then short JU7.

### Table 1. Jumper JU1 Functions(Shutdown Mode)

| SHUNT LOCATION | SHDN PIN            | MAX1714B<br>OUTPUT                     |
|----------------|---------------------|--|
| On             | Connected to<br>VCC | MAX1714B<br>enabled                    |
| Off            | Connected to<br>GND | Shutdown mode,<br>V <sub>OUT</sub> = 0 |

### Table 2. Jumper JU2 Functions(Low-Noise Mode)

| SHUNT<br>LOCATION   | SKIP PIN            | OPERATIONAL MODE  |  |
|---------------------|---------------------|---|--|
| On Connected to VCC |                     | Low-noise mode, forced fixed-<br>frequency PWM operation  |  |
| Off                 | Connected to<br>GND | Normal operation, allows auto-<br>matic PWM/PFM switchover for<br>pulse skipping at light load,<br>resulting in highest efficiency. |  |

### Table 3. Jumper JU3 Functions (Fixed/Adjustable Current-Limit Selection)

| SHUNT<br>LOCATION | ILIM PIN  | CURRENT-LIMIT<br>THRESHOLD       |
|-------------------|---|----------------------------------|
| On                | Connected to VCC  | 100mV (default)                  |
| Off               | Connected to REF<br>through voltage-divider<br>R3/R9. Refer to the<br><i>Current-Limit Circuit</i><br>section in the MAX1714<br>data sheet for information<br>on selecting R3/R9. | Adjustable from<br>50mV to 200mV |

#### Table 4. Jumper JU4/JU5/JU6 Functions (Switching-Frequency Selection)

| JUMPER        | SHUNT LOCATION | TON PIN                              | FREQUENCY (kHz) |  |
|---------------|----------------|--------------------------------------|-----------------|--|
| JU4, JU5, JU6 | Off            | Floating                             | 300             |  |
| JU4           | On             | Connected to VCC                     | 200             |  |
| JU5, JU6      | Off            |                                      | 200             |  |
| JU5           | On             | <ul> <li>Connected to REF</li> </ul> | 450             |  |
| JU4, JU6      | Off            |                                      | 450             |  |
| JU6           | On             | Connected to GND                     | 600             |  |
| JU4, JU5      | Off            |                                      | 000             |  |

**IMPORTANT:** Don't change the operating frequency without first recalculating component values because the frequency has a significant effect on the preferred inductor value, peak current-limit level, MOSFET heating, PFM/PWM switchover point, output noise, efficiency, and other critical parameters.

#### Table 5. Troubleshooting Guide

| SYMPTOM  | POSSIBLE PROBLEM  | SOLUTION   |  |
|--|---|--|--|
| Circuit won't start when power is applied.   | Power-supply sequencing: +5V bias supply was applied first  | Cycle SHDN by removing and reinstalling JU1.   |  |
|  | Output overvoltage due to<br>shorted high-side MOSFET   | Replace the MOSFET.  |  |
|  | Output overvoltage due to load recovery overshoot   | Reduce the inductor value, raise the switching frequency, or add more output capacitance.  |  |
| Circuit won't start when SHDN<br>and +5V bias supply are cycled.   | Overload condition  | Remove the excessive load or raise the ILIM threshold by changing R3/R9.   |  |
|  | Broken connection, bad<br>MOSFET, or other<br>catastrophic problem  | Troubleshoot the power stage. Are the DH and DL gate-<br>drive signals present? Is the 2V VREF present?  |  |
| On-time pulses are erratic or have unexpected changes in period.   | VBATT power source has poor<br>impedance characteristic   | Add a bulk electrolytic bypass capacitor across the bench-<br>top power supply, or substitute a real battery.  |  |
| Load-transient V <sub>OUT</sub> waveform<br>shows excess ringing.<br><b>OR</b><br>LX switching waveform exhibits<br>double-pulsing (pulses separat-<br>ed only by a 400ns min off-time). | Instability due to low-ESR<br>ceramic or polymer capacitors<br>placed across fast feedback<br>path (FB-GND) | Add parasitic PC board trace resistance between the LX-FB connection and the ceramic capacitor.<br><b>OR</b><br>Substitute a different capacitor type (OS-CONs, tantalums, or aluminum electrolytics work well). |  |
